David Briggs | 00:02
Hey guys, welcome to version two of ECOMM Architects copywriting program. A lot has been changing in the copywriting space, and there are a bunch of myths that need to be absolutely killed off.
The biggest myth going on right now is that copywriting is dead, when actually that is the biggest lie in marketing and could not be further from the truth. By the end of this course, you're going to see that copywriting is the single highest leverage skill in e-commerce and in business in general.
Actually, it's a skill for life because we're talking about the ability to persuade people and make people take action, which is what every single business owner needs to be doing. So let's get into this. This is a quick introduction.
So we're going to go through this quickly. Here's what most brands get wrong. So before we get into how to do copy properly and get it right, let's take a look at what people get wrong. So the first thing is agencies. Lots of people outsource their copy to agencies. This is the biggest lever that you have control over in your entire business. Everything that faces a customer is copy, and what you'll get from most agencies is essentially copy mills. In order for agencies to be effective and to be profitable, they have to have a huge volume of customers, of which you are just one. You maybe get a few hours a week spent on your account. You get closed by our absolute expert level, and then your copy tasks get passed off to some junior who they've outsourced to. That doesn't really do you justice.
It means that the biggest lever that you can pull is being outsourced cheaply and not much time is being spent on it. Most agencies are just building swipe files of every brand in your category, and that's why what they produce looks exactly the same. AI has allowed them to produce a much greater volume, so they can dazzle you with creative output.
But the reality is I would rather have a handful of winners than 100 losers that are going to burn through my budget. So be aware of the agency problem. The second is the copy problem. Copy makes people take action.
It's not content. There's a big difference between these two things. There's a lot of overlap at the moment, and people are spending time thinking they're writing copy when actually they're producing content. Copy drives action. Copy makes people take decisions. Direct response copy means they take an immediate action after they have taken what you're at, whether it's clicking to your page, whether it's making a purchase, whether it's signing up for your email. Really pretty copy is not necessarily the best copy. Copy is about driving action. Copy is about being effective. Sometimes it's ugly, sometimes it's clumsy.
It's often written like a third-grade reading level so it can't be confused. Copy needs to speak to the right people at the right time, meet them where they are, and drive them to take the next step in their customer journey.
If it's not doing that, it's not going to work, no matter how beautiful it is or how lovely it sounds. If you look at some of the top-performing as in your niche, you'll notice that their copy is probably very basic and very ugly.

If you gave Claude or GPT or whatever the same task, it would write you something beautiful, but it's not going to take action. And that brings me on to the third thing, the AI problem. Everyone's got access to AI so it's not an advantage anymore.
It's the standard isn't an expectation that people use AI. Any copywriter in my niche or any niche for that matter, that tells me they're not using AI. I just think that's stupid because what you're doing is you are handicapping yourself. AI is a tool to be used.
But here's the caveat AI levels the playing field. It brings everything towards the central point, it brings everything towards the middle. So the brands that used to suck are now being pulled out to the middle. The brands are performing well.
If they're not careful, they get dragged down into the middle because copy without expert judgment, without knowing your craft and understanding what drives action, becomes ineffective. That brings me to the next point.
Okay, AI can generate your copy, but it cannot generate your judgment. The people that succeed in business in e-commerce in this space have excellent judgment. They know their customers, they know their research, they understand the psychology, they know about sophistication levels and awareness levels. This course is designed to help develop the judgment of your judgment so you can better execute on your copy.
So you can create more winners more regularly, more confidently, and at a faster rate. That's what we're here to do. So before I go into the actual course itself, I just want to give you a quick breakdown about me and who I am and why you should be listening to me because I'm not a celebrity like Stefan.
So yeah, I've been in the copywriting space for a long time now, and during that time, I've generated over 100 million in sales directly attributable to the copy that I've produced. I've coached with the ECOM Architects community as well. Over 300 brand owners, ranging from people doing six figures up to people doing mid-8 figures. One of my biggest wins was an advertorial funnel that I wrote that generated 20 million. That was five ads and then an advertorial that went on to generate over 20 million.
Regularly working with CRO agencies to increase conversion rates. Typically, any brands that we worked with saw a 15 to 20% lift in their conversion rates. So I do know what I'm talking about.
I'm here to help you learn as much of that as I possibly can so you can absorb all the knowledge and be as successful, if not more so. So there are three little case studies here. The reason I brought these in is that these are all real case studies from my career, and these just underpin how important copy is. All of these problems. All of these results were generated by fixing the messaging through the copy. No clever hacks, no new apps, no innovative Facebook Insider black hat nonsense or any of this, just fixing the messaging through better copy.
So case study number one was a beauty device brand. After reading through... This is before the days of ChatGPT. After reading through hundreds of reviews, we found out that they weren't skeptical about the product. There were just a lot of people that had been burned so many times before that they thought they were the exception.
I've tried a bunch of things. Nothing's worked for me, so this isn't going to work for me. It's a very personal defeatist story. So we created our ads around UGC ads of people using devices talking and sharing their experiences and their results, and talked about biological response profiles. We talked about different skin types, different methods, different ways of using the

device depending on your biological profile. When people said, "These just weren't set up for my biological profile," we were able to create a shift in the way they thought about their problem to accepting that this device could fit their biological profile and get them results. That ultimately led to a sales funnel that generated over 12 million sales. Next case study was a men's skincare brand.

This men's skincare brand was doing big numbers, but they were struggling with retention. They were really struggling with retention. The reason was their messaging was completely wrong. They weren't listening to their customers, so after a deep dive into what their customers were actually saying, we created a complete reframe around the copy. Men did not identify with this idea of trying to look better or being this aspirational map. What they wanted was to maintain and hold on to what they had.

When we shifted the messaging away from this aspirational idea to this idea of maintenance and control and assertiveness, sales went right up. This is about building a routine that is simple, that works, that gets you noticed, that looks effortless.

That's what spoke to the men. To a 97% increase in revenue by changing the copy. Nothing else. The copy design stayed the same, list stayed the same. That was the only change. And then finally a pain relief brand. Pain relief is one of my favorite niches.

Because when you talk about pain points, there is no more real pain point than pain itself. But the problem is there's a lot of predatory brands, there's a lot of misinformation, there's a lot of people just making up absolute nonsense that's based on no science whatsoever.

And it's not that the customers had lost trust in products is that they lost trust in the explanations they have been told by ten different brands, ten different reasons why they were suffering with this problem.

And what they needed was science and proof and reassurance. And in order to fix that, we create a long form first person storytelling autorial from the perspective of their main most important ICP, where we debunked all of the nonsense around the fake explanations for their problems and gave them a real one that they could hold onto and believe in. That started out with a 2k spend and a five x ROAS on a two k spend that scaled to 100,000 and it held a think it was a 3.5 ROS at that level spent. This was kicking off a new brand in a very busy space.

But because the messaging and the copy were staled in, it worked and it landed. So why is it the highest leverage skill? This is why it's the highest leverage skill. Your product development depends on your messaging. Brands with brilliant products die every single day, not because their product doesn't work, but because their messaging is invisible.

And there are brands that are selling absolute, that excel every single day. I mean, I'd love to name some names and maybe I'd get on my life course and I might name drop some names, but particularly in the supplement space, there are brands selling absolute snake oil. Nonsense. But they're really good marketers and they're making a lot of money because of it. Media buying is an amplifier. If you are doing well, media buying will take you to the moon. If your messaging is rubbish and no one's responding to it, it's just a better way to burn money faster.

So if your messaging is not right, even a genius media buyer like Marin... If the ads are crap, he's limited to what you can do. Even though the guys are wizards, I'm a big believer in the importance of design.

I think things need to look a certain way. It doesn't mean they need to look perfect. We're not all trying to shoot Lamborghini ads. It means it needs to look right for the purpose. UGC needs to look scruffy. Sometimes native ads need to look authentic to where they're being positioned. But design will not carry bad copy. When you've got great design and bad copy, here's what happens. You have a click-through rate because people are looking at the design, and when they start reading the words, they realize it's absolute crap, and the bounce rate's high. Beautiful ads and beautiful pages that don't speak to the right audience in the right way don't convert. Finally, in this Andromeda era that everyone seems to be panicking about, there's literally nothing to panic about. By the way, your creative as you're targeting... That just means instead of telling Meta who should be targeting, you are showing them this is my audience in the ad. This is the problem we're talking about. It has gone from a tell me model to a show me model. That's it. That's the simplest way I can explain that. It brings me onto another point. You got to quote the greats, right? So David Ogilvy said, "When I write an advertisement, I don't want you to tell me you find it creative.

It's not an exercise in creativity. I know we call them creative, but it's not. I want you to find it so interesting that you buy the product. It's that simple clarity over cleverness. We are salesmen, saleswomen, salespeople.

That is our goal. That's what we're doing here. If it's ugly and clumsy and scruffy, but it works, that's a success story. Just going on to that creative becoming the targeting. So we know the old way. We could be hyper-specific with all the audiences and all that kind of stuff. We could do 50 variations of the same one. We change your hook and a headline. Background colors and stuff. Now they would all be competing together. Metta would see that as one creative targeting the same audience. The new way relies on your copy broad targeting. You want different concepts that speak to different people from different angles and different formats. The creative signals that you send out are what guide the algorithm, and you want to have fresh creatives continually in the process of being made.

So here's what I want you to take away from this course. At the end of this course, you are going to see that copyright is the most valuable skill that you could have not just in your business, but in your life. We're going to go through the foundation. Why it matters, how you can practice it, how AI fits in with everything. We're going to talk about customer psychology. What their desires are, our objections are, what advertised ICPs are, different awareness levels, that kind of thing when we look at strategic positioning.

So once you know who they are and what they're about, what they care about, how do you effectively communicate with them through mechanisms, beliefs, angles, category, reframes? We talk about the actual craft of writing itself, the different components, what hooks are, how to open loops, how to do storytelling effectively, how you handle objections in a way that doesn't look forced or uncomfortable.

We look at format deep dives. So it adds advertorials, do you need advertorials? Should you be using them? What's a VSL compared to when it had emails, landing pages? We're going to cover a bit of everything. We're going to look at algorithm strategy for SONA splits, AI production, and things that help with creative diversity, and then the learning loop, reading data, building your own systems, and all of that. Now, my one caveat for this is that this is my system that works for me.

It's worked for me, and it's worked for a bunch of other brands. There will be overlap between things because copywriting is in every single area of your business. It will overlap into creative strategy. It will overlap into email and SMS. It goes everywhere. This is about mastering the fundamentals and understanding the power of it. You can use all of this learning and adapt it to fit your own business model. There are going to be about 30-25 to 30 videos here, I think I'm estimating right now about seven hours of content. I'm going to try and keep them under 20 minutes so you're not too bombarded or sitting there watching it forever.
Ideally, by the end of each module, you're going to have a big takeaway, a new understanding, and you're going to feel more confident that you can produce copy that's really going to move the needle for you. Hope you enjoy this. This is V2. Let's get into it, guys. Good luck with everything.

David Briggs | 00:00

To the third video in the brand-new V2 copyright and series. This is why a makes the fundamentals more important, not less. Okay, now this is super important because the reality is that everyone thinks that now they've got AI. Copyright's an obsolete skill.
Then to explain exactly why it's not and why it's one of the, if not the most important skills, you can be continuing to build up. So let me break this down for you. Longest that we short. Everyone has AI. Now, to be clear, as a professional copywriter and strategist, I use AI every single day. In fact, I was in the first 1% of people to adopt ChatGPT when it first came out. Obviously, GPT's fallen a bit behind, and Claude is clearly the front runner right now, but the reality is that most marketers have caught up. They're using these tools. Claude, GPT, Gemini. Every brand, every freelancer, and every agency has access to the same toolkit as you do. So they can spin up some ad copy, they can generate emails, product descriptions. I mean, some people are even spinning up full pages now, ready to code and ready to put out there straight away. So, it's not
the unfair advantage it previously was. The reality is that it's very deceptive. So AI copy looks fine on the surface. If you gave it to your mom, your brother, your sister, someone who wasn't in marketing or whatever, and they read it, they'd go, "That sounds really good.
It's grammatically correct, right? It sounds like a marketer, and sometimes it hits the right beats. It can follow a pattern, but the reality is that most AI copy underperforms versus a professional." The question is, why is that? Well, the reason isn't the actual words themselves on the ad or the page. The reason is the decisions behind why those words are chosen. And that's what this module is about getting into.
Okay, so when you think about AI, this is what it can do. This is what it's really good at generating grammatically correct copy fast. It will match a tone of voice from examples. So if you give it some examples or you share your webpage with it, it can make some pretty accurate deductions from that. It'll produce multiple variations of a concept fairly quickly.
It's good for summarizing review data if you just pull all your reviews or competitor reviews into a big spreadsheet and say, "Analyze this for me." This is what I'm looking for. It's very good at that. It's good for drafting things when it's provided a detailed and structured brief, and it can follow a template or formula when it is provided with that information. Here's what it can't do though. This is the major limitation of AI, and this is why it needs to be used as a tool, one under direct supervision from a professional marketer that understands what's going on so it can't decide which... Desire to lead with only your customers, your audience, your market. Research can do that. It can't diagnose a failing ad from its metrics because the reasons ads fail and the reasons ads succeed are multifaceted. There are dozens of reasons in a single 30 or 42nd at it takes a trained, qualified professional to make the correct deductions based on watch time, runtime, click-through rate, previous experiences with the brand, etc. It can't identify the beliefs that are blocking a sale. Again, that comes from understanding your consumer psychology.
It's not very good at reading market sophistication levels. Have you ever asked AI to do that? It goes all over the place. It doesn't know which angles the market has and hasn't seen.

So unless you're again providing all that information upfront for it won't know. It will default to the most obvious and generic answer because that's what LMS do. They are designed on the average. They are a predictive tool to think what is the most obvious thing that comes next. That's what I'm going to write. They can't judge whether copy will actually convert. Now, to some degree, no one can know where the copy's going to convert. You can write an absolute bang on ad and it can flop.

It could be because there's something going on in the world that's distracting people. It could be because a new competitor has opened up in a new niche that is dealing with the same pain point but through a different kind of product or mechanism. There are so many different reasons. But a human, an expert human, is going to be much better at deducing whether copy is actually going to convert. So that's the advantages and limitations of AI so the left column. Going back to that, if we just look back at that, the left column is kind of execution, right?

It's good at executing. The best way to think about AI is like a super ambitious intern that's really fast working and desperate to please. They don't have the knowledge or experience, but they really want to churn out the work.

That's the way you should think about it. In turns useless unless they are directed under the expert guise of the person in charge. This is the kind of execution side. This is the judgment side. The judgment falls on you as the professional marketer, the professional copywriter, the CMO, the brand founder.

That's where the judgment comes in, and that is based on research, understanding your market, understanding your brand, understanding your audience, understanding the psychology that underpins the decisions that they're making.

Okay, so AI can handle execution, you handle judgment. The person who understands the fundamentals can direct AI to produce winners. Okay? Just the same as if you put me and Lewis Hamilton in a Formula one car, he's going to finish the race. I'm probably not even going to get round the track. I'm probably not even going to get off the starting line. We can have access to the same tools, but he's the professional in the driving seat. Same goes for you in your business, with your copywriting, you are the professional in the driving seat. AI is the person that's going to get you around the track.

If you don't do these things, if you don't have the research, the structure, and the understanding, it will just give you stuff that sounds really nice that will impact and move no one to action. This course is going to fill in those gaps to help you find out exactly how you find the research you need, the information, all of these things. It's all going to be included here.

Okay, I'm going to break that down in a minute. So what you get when AI is left to its own devices is the average. So you and I if I caught it like an envelope here, everything in life exists on a bell curve like this.

That's a bell curve. Okay, before you would have some brands down here at the kind of rubbish end of the bell curve. Now, because of LMS, almost everyone can at least reach this kind of middle point. Here everyone is somewhere within the realms of average because LMS raises the average standard playing field.

So now you could stand out if you were in here, but if you really want to stand out, you need to be here at the expert end, the end where you understand it. You don't want generic. Generic is flooding the market, that's why people are getting bought. Specific understanding of your customers is what's going to move the needle.

Okay, so generic angles are the first thing. Surface-level hooks. Tired of problem product? It's the first thing AI is going to generate because it deviates to what is safe and frequent. What we know as marketers is you need to be at the front end, the cutting edge. What's new, what's developing, what's working right this minute, that's where you get your edge. Is there a viral kind of social media phenomenon that's going on right now where we can use that hook and then make it into a paid ad? By the time something becomes generic enough for LMS to recognize, it's already lost its impact. AI doesn't know your customers' awareness level, okay? They don't know if they're unaware or product aware.

So it doesn't write to anyone specifically. That is, unless you are educating on that. If you give it the information and explain why the information is relevant, then it can start to make things happen. It can't do that before and again. Perhaps most importantly, it can't shift beliefs.

So if someone's stuck thinking a certain way, it doesn't know how to get them past that point again. Unless you tell it how to do that, it's going to read as a list of claims or a list of features or a list.

And sometimes LMS will add in some benefits, but it's not pushing past that. It's like this thing does X so you can experience Y, but then it doesn't go the extra step and speak to the desire so you can feel more confident.

Take advantage. Be the man you know you should be. Look better than you've ever looked before. Have the energy levels that you did in your 20s. It doesn't go that extra step. So it feels like it's tiptoeing into the edge, but it just won't jump off when it comes to LLMs.

I do a ton of work, and if you've ever received any of my documents, you'll know that my prompts are often several pages long. Okay, because specificity is a skill. So you might have some brands that are like, "This is my brand." Write me a Facebook ad for a sleep supplement. And you give it a couple of bullet points.

That's going to get you something very generic. However, an informed prompt where you have already taught your LLM everything it needs to know about your brand might look something like, "Write a 32nd script for cold traffic at stage three. Market sophistication. Use the mechanism reveal hook framework. Target women. 30 to 50 who tried melatonin and it stopped working. Conversational tones. Sixth grade level reading level leads with cortisol disruption as the mechanism." Now, in order for AI to do a good job of that, it has to know what all those things mean, otherwise it's just guessing.

So once you have spent the time teaching your LLM, prompting it correctly, and adding knowledge to its product and project base, then you can actually get it to do what you need it to do. But just opening up a new Claude, dropping a few screenshots in whatever...

That is not going to get you to the level of quality you need to stand out in this LLM-driven marketing phase that we're in. That leads me onto this thing: "Copy cannot create desire for a product."

Okay? The desire already has to be in the market, okay? It only takes the hopes, dreams, and fears of desires that already exist in the hearts of millions of people and focuses those already existing desires onto a particular product. You are not creating belief, you are shifting desire towards your solution and helping that person become the hero of their own story. Your product is just the vehicle that takes them to where they're meant to be.

I can arrange words. It cannot identify those existing desires. That is your job to do through your research. It can help you do that, but you have to tell it how to help you do that. So the three roles for AI in your workflow are the three biggest things.

One is your research assistant, not your primary researcher, your research assistant. You have to give it the raw data. It can help you organize and filter through it, identify customer language, repeat patterns, wants, and desires, problems, and things. People have tried that kind of thing. It can give you thousands of highly valuable insights when it's given the right information to start with.

It's really good for creating first drafts. So if you've got an idea, you've seen an ad in a competitor niche that you think would work for your ads, and you want to use that as a structure, AI can copy that to give you a framework.

So you're not staring at a blank page. You still need to make sure it's prompted correctly so it produces something worth actually watching, and you still need to very carefully edit it and make sure that each line of that copy is actually doing the job. The other thing that's great for is a variation engine.

So if you have a winning concept or an ad that's proven to be doing well in the markets in your target KPIs, you can then use AI as an idea generator. So with this concept, how could we spread it to other audiences? How could we create different variations?

If it was a UGC first-person, scruffy, ugly style, could AI do a B-roll version? Could we do an unboxing version? Could we do a review version? How can we do that? So it's good at helping you generate ideas very quickly.

So again, you're more staring at that blank page. So every time you're using AI in this course, you're making the judgment calls that AI cannot make for you. Okay? That's what's going to make the biggest difference.

So within this, there are several modules already marked up here. These are the ones you want to think about. So Module 10 is going to be which desires do I lead with? Number 12 is going to be what's the block in belief? What awareness level am I writing to? Is the mechanism real or a label? What why did this ad fail? Which angle hasn't been seen?

So you're doing the thinking behind it. It's getting the work done. Okay? That's the clear distinction. So, fundamentals plus AI gives you a compound effect. In effect, you can work quicker and produce greater volume and higher quality when it is dialed correctly based on your expertise as a marketer.

That's clear. So, without fundamentals, you get generic copy, no real diagnosis. You're starting from zero every time. It's not compounding, it's just volume. While I want to rant a little bit here, that's something to remember as well. A lot of agencies will dazzle you with, "We can produce a thousand creatives a month." Great, but how are you able to do that?

Well, you're using AI, but what's that? AI-based on volume in itself is not an answer. It has to be based on powerful insights and actual data. So, you are not just throwing everything at a dartboard and hoping something hits. You're actually taking shots based on evidence, research, and what you've already found.

If you give Claude, ChatGPT, or whatever the fundamentals, you get better market research and strategic precision. You can diagnose what's exactly broken. You can feed insights back into the next round, so you can start to use AI to create feedback loops. This didn't work, this did work. What can we learn from that?

It's already got all your information, so it can start to make actually useful deductions. Then, every campaign can make you smarter. Okay? That's what we're going for. So, this is the mental model to take away. AI is a tool, right?

Like the racecar example I gave earlier, like a drill, whatever. In the right hands, it's very valuable, and in the wrong hands, it's useless. The fundamentals are the skill. AI can be really good if the person operating it, who has trained it, and who has built the project for it is really good.

If you are coming in blind and you think you can just tap away at LLM and it's going to shoot out some four ROS scripts or whatever, that's not going to happen. Judgment is the moat.

So if you think about a castle and the moat around the castle, everyone has what they need, but the moat is at a skill level. People cannot get into the castle. That's still the last bastion of the fence.

So as long as you remain the best in your field at marketing, you still have an advantage even though everyone has access to AI, and then speed is the multiplier, not the launch point. When you find winning things, you can move faster, but it still has to be based on the research, the understanding, and so on and so forth.

This quote, I don't know where this quote came from. I found it when I was googling somewhere. But AI made average copy free, and it made good copy priceless. That really is the big takeaway here. Anyone can now produce average copy from anywhere in the world in a matter of minutes, but the good copy stands out even more because of that.

So next we're going to take a look at writing practice that actually helps you improve these skills, and that will be module for... Thanks for watching.

Transcript 4

David Briggs | 00:01
This is video 4 of the copy course. If you're working your way through it, we're going to talk about the writing practice actually builds skills. Most things in life, copywriting is about putting in the reps, being consistent, just like if you're going to the gym. Consistency is key here.
So let's take a look at how you can improve your skill and get really good at it. It's not about trying to binge learn copywriting in a week through videos. You're not going to do that. It's about continually putting in the reps each day until you get better, and it will eventually become automatic.
So let's take a look at what we got here. As I said, watching videos doesn't make you better. The same as if you're watching a gym video, you don't know whether that exercise is going to feel good.
It's going to stretch the muscles in the right way until you actually do it. You can watch every copywriting course ever made. You can read every book. I've got a bunch of books on my shelves. They are a tool, but nothing is better than just putting in the reps and getting the work done.
Okay? Copywriting is a craft, and it's about 50% art and creative thinking and 50% knowing fundamentals. You have to bring those two pieces together. The books and stuff can help you learn the fundamentals. They can't help you actually deliver the creativity and package the fundamentals in a way someone wants to watch.
So this is about a practice structure. The rest of the course is going to give you the reps and how to put in the reps. So, the three daily reps you can do, and really, you just need to set twenty minutes, half an hour aside, right? This does not have to be some epic huge commitment of your time as founders and brand owners. You're already wearing a bunch of hats. This should be something you enjoy doing
because learning... When you can nail this skill, it's fun. It's fun to write copy that's going to smash it. So first of all, read a piece of copy. Okay? There are tons of places to do this. I like LP Pagedex for e-commerce. You can go through LP Pagedex. You can search it by landing page, and you can just sift through until you find something that catches your eye.
I'll show you exactly what I mean by that. Then you want to read it actively, so you aren't just reading it passively like a customer, you're reading it actively like a marketer. What are they trying to say? What pain points are they hitting? How are they addressing their audience? What awareness level do you think they're talking to? Is this someone that doesn't really realize they have a problem? They're unaware, or is this someone that's quite advanced? Are they explaining in a unique mechanism? In certain ways, it just got really dark in here for some reason.
Then you want to write a page of copy. Now, again, it doesn't have to be for a client. So write a headline in a hook. Write five variations of a headline in a hook. Write an email or a landing page or wherever your main blocker is.
Maybe it's as... Right? Focus on writing as and figure out how you can use what you've just learned to write your own version of it. Why does it work? Then you want to come up with an idea. A new angle, a new hook, a new mechanism, a positioning reframe. Keep asking yourself what if? What if I approach this from the opposite direction?

If everyone says an X, why can't I say why? What would make me buy this faster? What would push me to take action? Why did this ad stop me? What was it about this landing page that made me stop when I was scrolling through LP Pagedex? When there's 50 on the screen and this one stopped me... What was it that did that? Was it the simplicity? Was it the headline catch in your eye? What was it?

When you start doing that, then you start to exercise those muscles and recognize those foundational building blocks that you can then use. Then when you've got them like a database that are there, it's easier to bring the creativity and bring those two pieces together.

That's what we're aiming to do. Okay, so when I say active versus passive, I want to be crystal clear on what that really means. Passive scrolling is like, "That's a cool ad. That's nice. I like the book that made me laugh." You save it in a SWIP file. When you never look at it again, it's just a dumping ground for things that caught your attention at the time. When you're actively reading, you're looking at what type of hook is this, is it a problem-solution hook, is it a controversial hook, is it a question hook? What belief is being shifted? Where is what is the customer thinking right now versus what they think at the end of the ad? What awareness levels are written to? How would I improve this if it were mine? A really good tool for this is the Daily Virals.

If you're not using it, I really recommend it. I know Amy recommends it in her course as well. The Daily Virals is a tool that crunches TikTok to find high-performing TikTok ads. A lot of the skills that are in TikTok ads can be used for Meta as well.

If Meta is your main focus platform. But when you go into the Daily Virals... Can you just see if I can? Just bring it up here quickly. Don't go to the Daily Virals. When you go to AI analysis... So you find an ad that's relevant to you go through AI analysis. What the AI analysis will do is look at the script and it will give you a breakdown of the script and then market sophistication, market awareness, market resonance, how it could be improved.

Speaker 2 | 05:35

The fact that people think I'm putting buffalo sauce on my lips.

David Briggs | 05:50

So what you can kind of do is use this as your teacher. So you do it first, then you have the AI on its video analysis, and then you see if you were right, were you wrong? Do you disagree with the AI's analysis and why?

This is a great way to test what you've been learning, test your understanding against a tool that's been designed to do that. It has a Consciousness Scale, and then some suggestions on how to improve the video. Now, for example, here, this has added a clear call to action. Now, watching this video, that might be the wrong play.

If it's a very organic looking video, then bolting on a very clear call to action might actually make it come across as really awkward and slimy and hurt the performance. So maybe that decision was made conscientiously.

However, it would be interesting to test a clear call to action versus what they've currently done, which is a very soft call to action. So you get my point there. Analyzing actively.

So going back to this... Questions to ask every piece of copy you read. Okay, why did this stop my scroll? What pattern did it interrupt? So did it look different? What was the thumbnail that made me go back on my attention? What's the hook framework? Is it an objection flip mechanism, revealed curiosity gap, what awareness level, what belief is it trying to shift so

where are they now, where do you want them to get to? Did it work? What's the mechanism? Is the mechanism real or is it a label?
What I mean is, like with the CRE micro infusion system, for example, it is a clear mechanism that is provable. It shifts the belief from topicals not working because of the skin barrier to this product penetrates through the skin barrier to deliver the ingredients below the surface of the skin where they're needed.
It's not that no skincare works, it's that most skincare isn't getting to where it's needed. That's the belief shift. That product uses a mechanism to make that happen. Where's the open loop? So are there any loops opened where they're like, "This changed my life from... I used to have testosterone levels of 400 db per liter, now I'm 800 db per liter. Let me show you what I did." That's an open loop, right?
"Okay, I want to know what happened. Tell me what happened. How did you get there? How would you rewrite this from a different angle of personal..." What I mean by... Let's say we were talking about testosterone levels.
For example, the guy who's in his 30s might be noticing a slight decline. It's very different from the guy who's in his 50s who's starting to feel like he's unable to lose weight anymore. He's feeling really lethargic and sluggish, that kind of thing.
So how could I take one ad that worked for the 30-year-old and mold it to work for the 50-year-old by changing that messaging? What would I steal from my own brand? There are plenty of brands that I really admire for their ability to capture attention. One of the brands I admire is Mars, Men. They run the most outrageous ads. I don't know how they get away with a lot of them, to be honest. They don't seem to be compliant in my eyes, but you can still learn a lot from them. They write great LPS. The design work is really good. There are still plenty of ideas I can steal from that brand and rework and rethink about and use for my own, so bear that in mind when you're analyzing copy and then a daily ideation prompt, right?
So keep a notes app on your phone and down which one you like to use. I save a lot of voice notes, and I'm sick of hearing the sound of my own voice, but it's convenient. So I personally save a lot of voice loans and then try and answer these things. What if I approach this product from a completely different angle? What other claims could I make? What else could I say about why the problems it solves, why the markets I can access, why this ad stopped me, what's the hook pattern? All of these questions, right? Everyone in a niche says X, so if we said Y instead, okay, or nobody's addressing this particular objection. What if we led with that? We've noticed through our review analysis that lots of people have the same objection, but no one seems to be talking about it. Let's tackle it head-on and capture all those people.
Then read a piece of copy. This is Kyle Milligan, a famous current copywriter. Okay. Read a piece of copy, write a page of copy, come up with an idea. Do this for 90 days, and you'll be better than 90% of copywriters.
I agree with that because what's really interesting to me about marketing is that the barrier for entry is very low, but the skill ceiling is incredibly high. So anyone can start calling themselves a marketer. Anyone can start calling themselves a copywriter or a creative strategist because you don't need any formal qualifications.
It's not like you've got to go to university and get a certificate or anything. But the proof is in the performance. The copywriters that are charging the big bucks and making names for themselves are lucky enough to be in communities like this because they've got track records,

they put in the reps, and that puts them ahead of 90% of people out there. To quote Alex Somosy, you can outwork everybody else, even if your starting skill level was lower.
If you are the guy or the girl who's prepared to put in the reps, then you can outwork everyone else, and you can become elite level within your niche, within your business, and it will show. So. Great copy. Really requires a bit of boredom. Matt probably talks about this in his mindset courses, but you really need to lock in. Again, to quote Alex Sonoma, he turns everything off, closes the blinds, puts his ear defenders on. He doesn't allow anything to distract him. I'm not saying you guys need to be that extreme, but block the time. Make sure you are fully focused on the task at hand and just dial in for it and you will get far more out of a 45-minute dedicated, seriously focused block of attention than you will have three hours of constant distractions.
So close everything. Block your time. Control your audio and the noise around you. I know a couple of copywriters who quite like to listen to classical music. I find any music in the background distracting. I can comment with ideas when there's stuff on the background, but I can't really do focused work.
Yeah, ditch the phone as well and then read it aloud. So the single best test for a copy is to read it out loud. If at any point it fails the coffee shop test that I've talked about previously, then it needs to be reworked. It shouldn't sound stiff. It shouldn't sound like it has been scripted. It shouldn't be clunky and awkward. It shouldn't sound scientific. It should be easy to understand based on how real people speak, with varied sentence length and varied sentence structure.
So something like "This supplement facilitates enhanced metabolic function through proprietary bioactive compounds." That sounds like something Pfizer would release. No one's going to understand what that's going on in. The people that do aren't going to care. Whereas something that says "This tells your body to burn fat instead of storing it." Super simple to understand. They mean the same thing. There is nothing to be gained from that scientific explanation, unless perhaps you are pitching business to business in the pharmaceutical field, which we're not. It reads like a textbook. The other one reads like a person. There's a really cool app called the Hemingway app. It's free to use.
If you ever find there's a paragraph of copy and you just can't figure out why it sounds... It doesn't sound right, drop it in the Hemingway app and the Hemingway Way app will help you rewrite it. You can use ChatGPT for this. This is too complicated. Let's use a metaphor in here instead. Let's use a simile.
It's like... Then give your explanation. You don't really want your copy to be above a sixth-grade level. The average reading age across the US is 12 to 14 years, so most people's literacy levels are quite poor.
For everyone whose literacy levels aren't poor, they're busy. They're on the... It doesn't matter who it is. Doctors, lawyers, engineers, highly qualified, highly intelligent people, they're on going. They don't have time to figure out what it is you're trying to say. You just need to say it in a way that they get it straight away and then can determine how it's going to help them use a swipe file. I love swipe files.
I have dozens of swipe files for different things. I'm going to show you a tool we'll use for my swipe files. So most swipe files are things people are told to do, but then they don't use them. The swipe file is a collection of ideas. Most tools nowadays have swipe files built in.

If you use... For example, you can just save and bookmark them. You can fill up a whole folder of ads, and then instead of having to go to Discovery and troll through the search bar each time, you can go to that library of ads and use those for your inspiration.
That's a swipe file. It can be headlines where you just screenshot and dump them on a Google Doc, different bits of copy, right? But you want to organize them in some way. Why did it catch your eye? What were the thoughts at the time you saw that? That makes it relevant when you come back to it. You can do it by format. You can have a static ad doc and a video script doc, advertorial doc, emails, whatever, right? It could be organized by angle type, whatever it is, just whatever catches your attention. One tool I like to use is called GetTo. GetTo is a browser organizer file kind of thing. I don't know if I'm able to share it on here, but check out GetTo. You can drag your folders into GetTo and just keep it as a living Squire file.
So when you load up your computer, GetTo pops up, and then everything you've been looking at is there on one page instead of you having to have 200 tabs on them. It's a good way to keep things organized.
So yeah, the 90-day commitment is really just to see if you've got what it takes to dig in and do and see the difference for this. So this is how you can break it down. If you miss a day here or there. I'm not going to lose any sleep. You're going to be fine.
Exercise it like a muscle. So keep putting in the reps, and you'll eventually, by the end of the 90 days, have a habit that puts you ahead of 90% of marketers out there. It really makes a difference.
So build the habits, start with just getting into the hang of doing it, then start looking for patterns, then start developing voice. What I mean by that is make it sound human. You'll write faster because you'll know how people are talking in ads, because you're going to be consuming it all the time. You will start to be able to do it much more naturally, and then you can start producing ads with judgment.
All right. So you can sit with a brief and produce something that's actually worth testing because you've done the reps, you recognize Pats, you've figured out how to speak to your audience. You've identified what's going to work, and you can put all those components together in a way that you're going to produce something that can actually go out there for your brand and hopefully hit a home run.
So that being said, read, write, I do it every day. Even if it's just for 10-15-20 minutes, whatever time you can spare block it. Ideally, you want to be doing about 45 minutes, but I understand that's not realistic for everyone. Next, it's what customers actually want versus what they say they want, and there is a chasm between those two things.
I'll see you guys in the next video. Take it.

Transcript 5

David Briggs | 00:00
Welcome to the video fire. If you're right, what customers actually want versus what they say... Because these two things are not the same. We all do it. We all have superficial reasons we give for making decisions.
But then there's a deeper driving force. That's what we're going to look at today because if, as marketers, you can tap into that deeper driving force, you will speak to your audience on a much deeper level and you will drive them into action much more effectively.
That's ultimately what we're trying to do with direct response marketers. So every purchase is driven by a desire, but the desire the customer actually articulates is the one they say they want is often not the real one.
For example, someone might say they want clearer skin. The reality is they want to look more confident when someone looks at them. They want to feel more attractive, they want to feel less self-conscious.
That's what really is underlying the desire for "I want clearer skin." I want a better pillow, right? No one just wants a better pillow. I want a better night's sleep. They want to wake up feeling fresh and not 20 years older than they are. They want to wake up without pain. I want to lose weight.
Well, being overweight is embarrassing. It's very socially unacceptable, makes people judge you. They want to be judged less. They want to stop avoiding mirrors. They want to stop dreading the summer and worrying about what they're going to wear when the clothes get small. I want a good supplement or I want higher testosterone levels. I use testosterone a lot because it's such a big niche at the moment.
But the reality is people want to feel virile, strong, healthy, and fit. No one wants to feel like they're over the hill and passed their best. They want to feel in control and they want to feel like they did when they were in their prime.
So the surface want is often what AI will write to and what a lot of your competitors will be writing to. The real want... When you peel back the layers of the onion, it's where breakout copy that has the potential for huge scale
lives now. Another Eugene source quote: "You cannot drive desire; you can only channel existing desire onto a particular product." I use this quite in my last video because it is relevant now. It is redirecting people already have the want. You have to direct them to the solution that fits. You don't have to invent it; it's there. Just aim and drive them towards the right product for them.
So there is a book called "Cash Advertising" that I strongly recommend everybody reads. It's on my reading list. It's by Drew Whitman. In it, he calls... He has the life force eight and then the secondary life force nine. We're focusing on the life force eight. Almost all of human behavior, in fact, all of human behavior is driven by one of these factors, one of these life forces.
So to go through and quickly... Survival life extension, that's one of them, right? That fits a lot of supplement, fitness, water filters, these kinds of niches about being fit and healthy and extending and the quality and length of your life. Enjoyment of food and drink.
Okay. Kitchen tools, meal prep, gourmet products, drinks like breads who are blowing up at the moment. They fit into their freedom from fear and pain. Anything that's in the pain relief niche,

anything that's like security products, like digital CCAC, TV, cameras, that kind of thing. Sexual companionship, things to do with grooming, fashion, dating, fragrance, appearance, all of that kind of stuff. Comfortable living. This is the nesting instinct.
So homeware products, sleep aids, ergonomic things, pillows, that kind of stuff. Then there's like superiority of status. This is where your luxury brands come in. That's why MES are still selling out on bags on a daily basis because it signals status. Then there's like care for loved ones, pet products, the maternity niche for baby products, huge gifts, safety, looking after the people in our lives.
Then social approval and belonging. Okay? Things like teeth whitening are the perfect example of social approval products. It doesn't improve the quality of your teeth or the length of how long they will last you.
It's just an appearance thing because we associate people with good white teeth with being of higher status than people with yellow teeth. So there's the Life Force Act. Now, not all of these are created equal. Some are urgent and some are more superficial. Doesn't mean they can't be used.
But there is a likelihood that your product will fit multiple life force driving factors, and they can become the big idea behind your acts. So for example, number one, health and survival. It doesn't matter whether you're rich or poor, young or old, everyone is looking for ways to protect their health, improve their health, and become the best of what they can be.
So it has a big town and a big audience. Everyone is looking for that life extension status. In this age of social media with everyone Instagraming their lives every ten seconds, it's massive. Status really matters because people judge each other on what they wear, what they drive, how they look, all of these things, so it's more visible than it's ever been before and more people care about it. Sex and attraction. No one wants to be alone. No one wants to be lonely.
So any products that aid your appearance or improve your attractiveness are going to be high up there. Comfort another big driver. Okay. Particularly when people start to feel pain, if there's a pain to escape from, then comfort becomes fundamentally more important.
But people get to a stage in their life where they want to nest, settle down, they want to have nice things around them, control, belonging, they're all there. So the elevation strategy is how you can use the same product but speak to different desires.
Okay. So it's completely different at... So this example is kind of... How you could apply it to different life forces for the cure micro infusion device. Okay, so if we wanted to target belonging, we could talk about joining 50,000 women who switch to our home facials. This is about being part of a group, part of a movement.
Right away from expensive clinic treatments towards something else. You go with comfort clinical results without leaving your bathroom. That's comfortable with the cure micro infusion device. I could talk about the actual physical comfort of it and talk about how it's not as painful, how it doesn't have downtime, these kinds of things. Control taking control of your life. Stop relying on your dermatologist's schedule. Don't keep paying for these offensive treatments. You don't need to go to that extreme level. You can do what you need to do right here at home, and you're not accountable to anyone else. Sexual attractiveness, right? He asked if I'd have work done. I just smiled.
Right. If you're dating, if you're married, then... Ideas around how your husband or wife is now a little bit more into you. Maybe they're a little bit more touchy, feeling a bit more flirtatious.

So they know you're looking after yourself. They can see it in your confidence, but in your skin status. The device dermatologists use on themselves. It's a super strong angle for cure because of the brilliant white listing partners that they have. It's massive credibility and status-based on the fact that real expert, high-level dermatologists are out there promoting this product and saying, "Yeah, we would use it, we do use it."

This kind of health survival, your creams aren't reaching the layer where aging happens. So if you really want to do something about this, you need this new method, this new device. That's how you're going to achieve that.

Okay? So that's how you can elevate through your way through from the weakest ones to the strongest ones. But all of them are worth testing. At different points in your final different awareness levels, different things might resonate with different people.

If, for example, I'm a product to wear, and I've decided in my mind that I'd really like to give at-home micro infusion a try, then I don't really need to be told the creams aren't reaching the layers where aging happens because I'm already sold on the mechanism.

But an ad that speaks to 50,000 women who've already switched to this device is very compelling. Because now that's helping me make that decision. That cure is the right brand for me. Okay. So the next thing to talk about is the means-end chain change.

So a lot of LMS, particularly junior weak copywriters, will start with features and maybe get as far as functional benefits, but they don't go much further than that. So what you can do is turn every product feature into an emotionally compelling benefit using this chain.

So it's a four-step chain. Okay, the feature might be breathable bamboo fabric. The benefit of that is that it keeps you cool while you're sleeping. The emotional payoff is you get to sleep through the night and wake up feeling energized, and that's tied to comfortable living and survival as the biggest life force triggers something like a non-slip grip knee brace. The benefit of that is that it's not going to move around when you're doing activity. The emotional payoff is you can forget it's there. You can move freely without constantly adjusting it.

If you want to go play squash or paddle ball, whatever, you're not going to be thinking about this thing slipping constantly. It's not going to detract from your experience. That speaks to control and comfort.

So the case study that I gave in my very first video applies here as well. So this is how we did it. Okay? We were able to increase revenue by 97% for our men's skincare brand. And what customers were saying was, "I want to look better, I want better skin, I want anti-aging products."

But what they actually wanted was not to slip, not to feel like they were going backwards. I noticed when I sloped. They wanted aggression, avoidance. They weren't trying to aspire to be George Clooney or Brad Pitt. They were... "I want to look good for me. I want to keep up this routine, and I don't want to end up going backwards. What I'm doing is working. I just want to keep being the best version of myself.

So that email changed that way of thinking changed everything in our emails. We started selling maintenance of control and speaking to that ego, you're not the kind of man who lets things slip. You're the guy who's in control.

You know what's going on in your life. You know where you want to go, where you want to be, what you want to look like, and who you are. This product helps you maintain that control. It's

easy to use, it's quick to apply, and it's not greasy. You're not going to be embarrassed about buying it or wearing it.
That's how we were able to win a huge amount of money to their email revenue. So here's how to find the Real Desire. Okay, so first of all, you need to spot the Desire. Watch for complaint patterns in reviews, forums, and comments. Look for the wants and needs, and then follow where people spend their money and attention. A great source for this is obviously Reddit, where people talk a lot more freely. They're not really in a marketing mindset; they're more freely expressing their thoughts and desires with less of a filter. When people write a review, they in their minds have it. That review has to be written in a certain way.
So just try and get a good spectrum of different opinions and start to make deductions from there and then test its power. So you want to score it on three dimensions of scope: how many people are sharing it? You can use your LLM to help you with that.
If you've got a thousand reviews and comments and stuff and five hundred people are talking about it, 50% of people are talking about one thing that's good scope, and then urgency. How desperately do they want their relief?
If it's the pain relief niche, then probably pretty desperately. They want it now instantly. If it's the luxury niche, it's not so urgent, but there's still urgency. If a brand-new bag comes out, they want to be the first people to have it right.
Then staying power. Does it renew continuously? Are people still coming back to that same problem? Are new people discovering they have this problem and going that way? Map it to your Life Force A and then check the market. Is this Desire being served by competitors? Because if you're all going in and making the same claim, whoever's been there the longest and has got the loudest voice in the biggest ad budget is going to be the ones that stand out. You need to see if there's a different approach that you can take and then lock it in. Choose one. The rule of one is really important. One Desire, one Argument, one CTA, one Angle, one Focus. Because that way, when they watch your ad or read your landing page or whatever, they're not going to be confused that you're trying to solve ten different things. They're going to be dialed into that one thing that they need fixed and see how your product fixes that.
So people don't buy products, they buy better versions of themselves. This is really important to remember your product, no matter what it is, is not the hero of the story. The customer is the hero. Your product is the thing that helps them reveal, unlock, become, and be the best version of themselves that they can be. Their Neo from the Matrix kind of persona.
Okay? Your copy is helping them get there to the realization that if they have this thing, they can become that person. That's what we're aiming for. Song, if you're going to do a Desire Audit for your products, it goes like this. The Stated Desires of what Customers say they want, the Real Desire, what they actually want, how that is connected to the Life Force 8. What's really the reptilian primal motivator underneath? Then doing the means-end chain that I shared earlier, which shows you how you take it from product to feature desire and then connected to the life for eight and then a competitive check.
Okay, it's really worth doing. All these foundation blocks will save you hours and hours of wasted time in the future if you do these fundamentals correctly. I'm a big believer in building the foundation. Then everything you build on top of it becomes ten times easier.

It's about sharpening the ax, measuring twice and cutting once. This is the way to approach it with proper proven strategies, with proven research, where you are building on confident hypotheses based on what you have discovered in your market.
So find the real want. Everything else is downstream of that. Okay, right. Next up is how to read reviews like a detective and get the most from them. That's what we can cover in our next video. So you guys?

Transcript 6

David Briggs | 00:00
Hey guys, welcome to video 6 of the new VSL course, "Reading Reviews Like a Detective." Now, why is this important? Because reviews, competitor reviews, ready threads, all of this, they will do your marketing for you
if you know how to use them. They are an absolute gold mine of information, and it stops you from having to guess, meaning you can start leveraging what people are already saying because they will tell you the answers.
If you know how to listen for them. So let's take a look at this. So, most people tend to do this. They scan five-star reviews for quotable phrases and then drop them into ad company things like "Old customers love us. Here's what they said."
It's kind of surface level. That's not how to leverage reviews when you are in detective mode, and you should be spending about 80% of your time on research because, as I keep saying, getting the foundation right is what's going to move the needle for you.
So you want to spend two to three hours of research for every one hour of writing. So at least double the amount of time researching because it will make the writing so simple once you've done that. What you should be looking for is patterns. The best marketers I've ever worked with, people like John Benson, the guy who invented VSLs, is an absolute genius of pattern recognition and mastering reading patterns. His brain works like a computer, looking for contradictions. Where are people disagreeing in the comments, and how can you monopolize on that?
What's the emotional fingerprint of what they're saying? Is it frustration, fear, worry, concern? What is it that's underpinning what they're thinking? Look at what customers mention first, which words keep repeating themselves, and where the emotion lives in the phrasing.
If you find those insights, that's what will drive your ad performance. So Gary Halbert famously said, and if you haven't read the Warren Letters, you absolutely should. Gary Halbert famously said, "The only advantage I want is a starving crowd." What that means is the reviews will tell you what your crowd is starving for. What is already out there that they are just not getting satisfaction from.
If you can figure out what it is, where the gap is, and what's missing from their experience, from their solution, from what they're trying to achieve by reading between the lines, that is your fuel, that is your market.
That is where you generate hundreds of millions in sales. Okay? So you need to find the starving crowd, and they're already there. You don't have to create the crowd, you just have to find this chair is uncomfortable. The two to three-star review gold mine.
If you've been on any of my calls, you've heard about this before. I love the two to three-star reviews. Five-star reviews. They're fun to read, especially if they're your five-star reviews, but you don't get a lot of knowledge from them. Most of the time, someone's put five stars. They're doing what I normally do when I review stuff, which is just...
Yeah, it was great. Whatever. I'm not caring, I'm not putting thought into it. Some people who take more care than I do, they might tell you one specific feature they were really impressed with.

Okay, so it's not completely useless, but it's not going to give you your best learning. One-star reviews typically have a massive issue, so it's either a faulty product, poor customer service, or not particularly product-related unless it completely failed them. They were sold a dream and given nothing in return. They're normally very angry people. There's not a huge amount of learning that can be done there.

If you do know, it's someone that's in your niche that has a big market share. But they've got very poor reviews. Filter out all the ones that are related to logistics, shipping, and that kind of thing.

Then maybe you can find some useful information there. But the real goldmine is the two, three, and sometimes the four-star reviews. The reason for that is that no one flicks two, three, or four stars, particularly two and three stars, without having a thought process behind it.

So often, it means they've weighed up the good things, the bad things, they've been disappointed, and they give a reasoned and rational response as to why they feel that way. They've had an unmet need. There's an objection. There's something going on, and that's where you can get your most valuable insights to use in your own marketing.

So these are the four patterns I recommend looking for. You can train your AI models to do this. Okay, so frequency, what words or phrases keep showing up? Of course, dozens of reviews. So for example, if people kept saying things like, "My God, finally, something actually does what it says," then you might want to echo that, which we call the echo effect or the power effect in psychological terms back to the audience. "Finally, something that actually works for the problem."

Okay, that might get attention. Look at the emotion. What language gets banded about, right? Are there exclamation marks, capital letters, or emotional phrasing? Are there lots of feeling words? "I actually cried looking at my skin in the morning after."

That's not really related to the product. It's related to how good that person feels inside about the transformation that they've just had. Again, that's the type of language that can be recycled into your ads. Contradictions, right? Where do the reviews disagree with each other?

If there are contradictions, particularly if they're in your own ads, there might be a miscommunication in messaging. Maybe some of the ads are overselling certain features, leaving people disappointed, whereas other ads that are driving are giving people realistic expectations. A big one with the skincare niche is the speed of the transformation.

So a lot of brands slip up and lose valuable customers because they overpromise on the speed of the transformation, which they're not able to deliver. So contradictions can teach you a lot about what's going on. Then there's the surprise.

So what extra advantage did they get that they didn't expect? So in my own experience, for example, I've been taking Shilajit, and it's been improving the quality of my sleep. I feel like I'm sleeping deeper now.

That's not initially why I started taking it, but it was an unexpected benefit. That could be an angle. So if there was a Shilajit company out there, they might want to focus on improving the quality of your sleep.

It's a completely untapped market. We can link that back to the Life Force eight of comfort and even prolonging life and survival, because higher quality sleep means better hormone control, better emotional control, better healing, and everything else in your body.

So there are four patterns to look for. So here's how it works. A raw review language might be, "I've tried so many devices that just sit in a drawer." What that's telling you, though, if you read between the lines, is people are actively looking for a solution. They're willing to spend money on it, but they've been burned, they've been overpromised and underdelivered. Trust is low.
So your copy needs to address that. You need to hit that head-on and say, "Look, there's so much snake oil nonsense out there. This is why none of those things work. Here's what will work so you can finally get the result that you want."
I was shocked by how my skin looked the morning after. So in that case, it's about the speed of visible results. I didn't expect that to happen so quickly, so you could lead with an overnight transformation, noticeably different by morning.
That's huge. Could be it's like getting a facial without the appointment. Okay? Convenience framed as freedom. It's like I can get this thing that I really want without any of the negatives of having to travel, book an appointment, pay for a dermatologist, and get a consultation. I don't have to go through that anymore. I can do that at home. My husband noticed before I even told him. Now, I love this angle because men speak for themselves. We are not particularly well known for being super observant.
So an angle where the husband notices is going to resonate with a lot of women that are like, "Finally, I've done something that he's actually noticed." So it's fun. You can use it as a humor angle, which humor is a great tool to use in copy. I'm forty-six. I finally feel like I'm doing something real, so that finally a real together is like the kind of "aha" moment.
I've been trying all these different things, I've gone through all these different products. I finally feel like I'm doing something that gets me to where I want to be at last. It's that relief from not experiencing results that were promised from other products.
So here's where you can find the good stuff, right? Amazon reviews. Okay, Amazon reviews are hugely valuable because Amazon is so good at collecting reviews, they send a follow-up email after every single product is purchased.
Mine for reviews. That means that there's normally thousands. So you can find either your product or an adjacent product on Amazon and deconstruct their reviews and use that learning.
TikTok and Instagram comments. What are people saying in the comments when they see a product or watch an ad? What are the things they're making? What are they saying about it? Again, they'll be pretty unfiltered. They're not really thinking.
So you get a different take on what you do with the Amazon reviews, ready threads, and forums. They give you long-form content that you can do a lot of learning from. You'll often see things called mega threads on Reddit where lots of contributors are in there, and they're all offering something different. Have you tried this or I recommend this product as I had this experience?
All of that gives you learning customer service looks obviously from your own customer service. What people are asking... One of the most successful tutorials I ever wrote that generated somewhere between 12 and 15 million, I think, was based on customer service logs. We took all the most common objections. This was before the date of GPT, so we did it manually, took all the most common objections, and we created an advertorial that dealt with most of those most common objections, and I answered them in a simple, easy way to understand.
So anyone who had that confusion before new customers didn't have it. They were happy to purchase, checkout, and they were happy with their product. Then obviously, competitor reviews, not just your own reviews, but competitor reviews not on Amazon. Other direct

response marketers in your space, other brands that you're aware of, and it can be your niche or adjacent niche.
Okay, so one brand I'm working with at the moment, for example, sells swimming goggles. There's not a lot of people doing direct response with swimming goggles, but there are a lot of direct response cycling products. There are a lot of direct response ski products, and they're based on a similar ideology about performance, quality, and experience.
So we can look at competitive reviews in that regard and see what learning we can get from there. The power of your copy is in direct proportion to the depth of your research. This means the better your research, the better your copy. In simple terms, it can feel like a drain at the beginning to spend so much time on research, but the more you dig, the more angles you will find.
Then, when it comes to actually writing and putting together that copy, it is ten times easier because of it. So always start with the research. Your research document should be a living, breathing document that is continually updated, refreshed, and renewed. You're adding learning to it all the time, so that's how you can incorporate AI into your workflow.
Okay? It does the sorting and organizing, you do the interpretation of it, right? So you could collect... I mean, these are quite small numbers. You can collect as many reviews as you want, basically, but start off with maybe 100 to 200, right? Amazon your site, competitors' sites. Okay. Include the star rating, dump them on a document, and then prompt AI to cluster them so organize them by primary emotion expressed. How frequently does it come? What signal is it sending? Use the exact phrases, do not let AI paraphrase for you, and then prompt AI to find expectation gaps.
So what are the five-star people saying? Then what are the two and three? Why is there such a big gap? Why is there, for example, 20% of reviews that are five stars, and then as a significant number that are much lower? Where is that gap? What can we learn from that?
Then prompt AI to extract customer language. List the 20 most repeatable phrases across all reviews. Get it to flag any words that appear ten or more times. They can be your hooks, and then you interpret the output.
So AI gives you the data, you decide what it means. How does that fit into what you know about your audience, the psychology of them, what the decisions they're making, and then which phrases are going to work for what you're trying to achieve?
So here's what you can do with what you find. Okay. So a repeated emotion. That becomes the emotional core of your next act if you have, for example, lots of people saying that they've just got so many devices in drawers, and they're sick of them, and they don't want to buy anymore, that frustration becomes an emotional idea behind your next act.
If there's an expectation gap, then you can do a before-after bridge angle. So here's how the competitors let you down. Here's what you're doing now, where you're getting the results. Here's how this product delivered that thing that the competitor couldn't. It could be a surprising benefit, right? Something like, "My God,
I knew it was going to do this and this, but I didn't expect it to do this and this as well." That could be an untapped angle like my Shilajit sleep example. It could be a specific phrase that then becomes a brilliant headline. One thread. My God, I wish I could find it. It was a Reddit mega thread, and it was written by a guy in his 20s.

The hook, the headline in his Reddit thread was something like, "My teacher said I looked like Jeffrey Dahmer." Then he goes in to explain about his eyebags being an issue, and I was like, "My God, this is a pre-made advertorial. This would make the most compelling piece of copy. What a comparison to make." You have to be super careful with it for compliance for obvious reasons.

But the ideas are out there. Or it could be a contradiction by an objection to address why some people say they love it, and why some people say they don't. You can address these head-on, right? So for example, in skincare, it could be all these brands promising you're going to look 20 years younger, and you could just hit that head-on and go, "I'm sick of brands and keep promising I'm going to look 20 years younger, and then build in the pro-aging angle. I don't want to look 20 years younger. I want to look really good. For me, I'm okay with being 40, 45, 50. I just want to look good, and this product actually does that. I can go with less makeup. I feel like it's working. My skin's bright and glowing."

So if you're tired of being told you look, you want to look 20, and you want someone that actually works for mature skin where you are right now, then this is the thing. Now that is a great way to leverage a contradiction angle.

Then deliverables. Okay, so I completed the review analysis. It could look like this, for example, the top five repeated emotions, the expectation gap, the three surprise benefits that people figure, ten customer phrases you can use directly verbatim as they are, and then a working AI prompt so built specifically for your brand that you can reuse every time you launch a new product or angle. You can have Claude or whatever generate that for you and then you keep it and add it as and when you need to use it.

But it will draw on all the information you've already extracted because you've done the foundation work. The real takeaway from this is that the best angles are hiding in your reviews, your competitor reviews, and the Reddit threads.

Right now, you just have to go and get them. They're right there. Next up is the objection behind the objection. See you in the video.

David Briggs | 00:00
Hey, guys, and welcome to module seven of the ECOMM Architects Copywriting course, version 2. Today we're talking about the objection behind the objection. Now, this is a hard-core, sales-focused thing because if you've ever done sales, I used to do door-to-door sales way back in the day. You get very good at handling objections very quickly.
The way you handle objections is knowing what people really mean. So let's get into this. Today we're talking about the objection behind the objection. What that means is what they say is their objection and what they actually mean by that. We have to become translators for our customers.
That's the purpose. Apologies for the weird lighting in here. So every stated objection has a real one underneath it, right? The stated objection is the shield. It's the easy way out. That means that they don't really have to address the underlying one, which is their fear.
So you don't want to address the thing they say you want to identify what it is underneath and address that. If you address that, that's how you can convert people. So something like when someone says, "It's too expensive," what they really mean by that is, "I don't believe it'll work well enough to justify the cost."
So there's a belief gap that needs to be closed. If they say, "I think it's too expensive," it's like saying they're not convinced that it's different from what they've already tried. Does it actually work? I've been burned before, and I don't have a lot of trust in new products anymore. I need to do more research, right? Something feels a bit off, but I can't articulate what.
So there's a gap in education. They don't understand how something works. Then if you get something like, "It's not for people like me," that's weird that that's gone like that, but there we go. It's not for people like me. Then they've already decided that they're the exception, and we need to show them how the new mechanism is applicable to them.
So that's what we're talking about here. So the real objections fall into three major categories. The first one is trust. So if they say something like, "I don't believe this will work," or "Any of the underlying ones, I don't believe this will work," it's proof. They need more proof and more credibility before they're willing to risk any money again.
So you're going to fix that with proof stacking, showing testimony, showing expert reviews, showing social proof, giving them risk reverse, offering them guarantees and protections so they can feel like they can trust it and they can try it without that fear that they're going to fail again. Identity is the one.
So this isn't for someone like me. That means they've excluded themselves. So the way to get around that is to address them directly. You're probably one of those people that thinks this isn't going to work.
Maybe you've tried this before. You really need to look at self-recognition hooks. So that's going back into your research, looking at how people identify themselves, and figuring out how you can make your copy inclusive for that person.
So they go, "Wow, I actually feel seen. Maybe this is for me." Then there's risk. Okay, what if it doesn't work, and I'm wasted my money? Absolutely massively common objection for almost everybody in almost all scenarios, the downside basically feels bigger than the upside.

So they feel like they're gambling on something. So you fix that with guarantees, trial offers, and things like price trivialization. What I mean by that is if something costs $100, but then you work it out, and you're like, "Well, it's only really $3 a day. That's nothing, right?"
Then outcome anchoring. Don't get them to focus on what it costs. Get them to focus on the transformation and how great they're going to feel afterwards, because that transformation is priceless.
So Eugene Schwartz says, "To write good copy, you have to play a dual role at the same time. You have to be a copywriter and a prospect." You have to develop an almost foolproof sensitivity to these inevitable reactions. What basically means is that because Eugene Schwartz is a bit of a wordsmith and a scientist, you need to look at it. Put yourself in the shoes of your customer. You have to imagine what objections they're going to be raising with, and if you can get into their heads and handle those objections in real time as they're thinking of them, then that's what separates good copy from just phenomenal copy. By the time they get to the end of your ad or your advertorial, they're going to be in a position where they're like, "There's... I don't have anything left to ask. I can clearly see this is for me, there's proof that it works. I don't feel like I'm being pushed into something. I feel like I understand the product and how it works.
I've got my guarantee. I'm ready to make a blind decision right now." That's what we're aiming for. So the diagnostic process for figuring this out is to work backwards from the state of objection to the real belief.
So what did they say and what does that really mean underneath? So you want to write down the state of the objection exactly as the customer would say it, like it's too expensive. Does it work? I'll think about it. Whatever, that's it.
Then the next step is to ask what would have to be true for this not to be an objection. So if price is the objection, what would make them not care about the price? If trust is the objection, what proof would make that disappear?
Okay, so if what they said was true, what would need to be true in order to erase that? The third thing is to ask what past experiences created that objection. Did they try something out and fail right? Did they buy a product that over promised and under delivered? Did they spend money on something that didn't deliver the promised results? Were they promised something that was just never ever going to happen, right?
Like these skincare brands are like, "Yeah, you look 20 years younger. Ridiculous is ridiculous kind. Then you want to name the real belief. So write it as a specific sentence, right? Not, "They don't trust it, but they believe no topical products can reach the deeper layers of skin where aging actually happens." This is my CRE example.
So that's what they really mean by that, right? They're like, "Nothing I've put on the surface of my skin is tackling the problem in a way that I want." Then categorize it. So is it a trust issue? Is it an identity issue or is it a risk issue? What is the key thing that's blocking them from taking action?
So again, going back to one of my previous case studies, and again, this is a true case study from my career as a copywriter. So the stated objection was, "I'm not sure this will work for me. Results probably vary by person."
That's what they were saying, right? The real objection was, "I've already decided I am the exception." So it's not that they believed it wouldn't ever work, it's that they believed it wouldn't work for them.

So this is an identity issue. They weren't skeptical about the product, they'd already excluded themselves. This looks great. I'm sure it'll work great for some people, just I'm not one of them. So the fix for that is to not keep selling on the benefits because they already believe the product will work, they just don't believe it will work for them.
Then reposition around these biological response profiles. So the idea there is, if it hasn't worked, it wasn't built for your skin type. The viewer identifies themselves before the pitch starts, right?
So it's like, "These other things haven't worked because of my skin type, but this will work because it's addressing my particular skin type." I can now include myself in that. I can recognize myself, the copy is speaking to me, speaking to my identity and self-recognition there. About really getting into the mind of the customer and how they are perceiving themselves in this situation and saying, "Actually, this is designed for people that have your biological response profiles."
That's why we've created this product. That self-recognition replaced persuasion. They didn't need more benefits; they believed in the product, they just didn't believe it would work for them. So they needed the connection to say, "Yeah, this will work for you."
Here's why. That was the biggest advertorial they had in that particular year, the most successful one with the highest earnings. But... Maybe it was all because we diagnosed the problem based on what they were saying versus what they actually meant and were able to position ourselves accordingly.
So another case study, right? The stated objection might be something like, "Too expensive for vitamins." Or, "I can get similar stuff at the chemist." The real objection is, "I don't understand why this is different from what I already have."
If I see one vitamin supplement over here, that's like $20, and this one's $200, but they, on the surface, seem to be doing the same thing. Then I'm like, "What? Why would I pay that when I can pay this?"
Okay, so there's a trust issue there. They couldn't see the mechanism. They couldn't see why this was worth ten times as much as this one. So you need to educate them on the mechanism. Why is this better? How is it different?
Then they can see past it if you don't explain that. I have these conversations with my wife all the time. She'll say, "We need to get this one." I'll be like, "Yeah, but this one..." This is the example, actually. Last summer we bought a barbecue, and she wanted to get a Webber kettle. I know Webber's a well-known brand, but there are a bunch of other well-known brands that had a bunch of really good trust reviews and stuff. The Webber one was like $250 or something. The one I was looking at was like $100, not insignificant, but significantly cheaper than the other one. And it wasn't... I didn't believe her that it was better, but she couldn't tell me why it was better.
So I'm like, "They're just metal drums that you put coals in. What is it about this one? Are they just really good marketers, or is this actually a much better product?"
But I'm married, so eventually we went with what she decided, obviously. So the same principle applies here. It's not that you don't want to justify the price. You want to explain the mechanism so you can show what the ChatGPT board supplement can do and why.

Then, once the mechanism clicks, and they're like, "Right. So this has this trigger, and it uses this quality of thing." Now I understand how it works. Now I can justify why it's that much better and why it has that price.

So the stated objection was the price. The real objection was not understanding the mechanism, how it was a better product. So the copy strategy is education. You don't change the price. You educate people up to that level where they can see that. "I get it now. This is why it's so much better. This is why it's going to get me the results I want. I'm not concerned about the price anymore because I understand why it is here instead of here."

So when to raise objections before they do so, sometimes the strongest move is to bring up the objection yourself. This works really well if you're in a market that's been... You've got a lot of burned-out people, and they've all sick of it.

So you raise the signal before confidence. You raise the first signals, the red flags, and earn their trust before they have a chance to have the objection before they can go.

"I've heard all this before." You get in there first, right? Again, another example from my life. At times, I used to get bullied because of my red hair. It was kind of a common thing in the UK. I'm not really sure why.

I've got a whole bunch of red-headed people. But I would introduce myself as Ginger Dave. I'd be like, "Hey, I'm Ginger Dave. Nice to meet you." And immediately by doing that, I took the power away from the person who could potentially insult me and took control of it because I now owned that introduction. It normally made someone smile. It took the sting out of it and got that potential to be bullied out of the way, the same principle applies to handing the objection first.

So it's like, "Yeah, you've probably seen these claims and this brand saying this thing and/or whatever. But I'm here to tell you the real deal. This is what's really going on. This is what they're missing. This is what you need."

This is what we have, right? So you want to preempt things when the objection is nearly universal. So everyone in your market might be having the same thought. So in skincare, a lot of people think that anti-wrinkle creams and serums don't really work.

They're a nice moisturizer. They might help with really fine lines, but they're not really doing much. So you can address that head-on if it shows up in a lot of two and three-star reviews, right? Ignoring it basically feels dishonest. You have to address that to build trust. You don't want to preempt it when only a small segment has that objection.

The reason I say that is because if 90% of the market doesn't think it and 10% do, if you bring up the idea, you're actually encouraging more of the 90% that weren't thinking of it to now think of it. So you're introducing a problem that they might not have thought of previously, and that's not going to help your case.

So preemption in practice, right? This is the kind of how it could look. Quick example. So without preemption, this is not addressing things ahead of time. The CRE Micro Infusion system delivers clinical-grade serum deep into the dermis using 24-karat gold-plated needles for visibly smoother Thermer's skin. The customer is already thinking, "I've bought three devices that are in a drawer. Why is this different?"

So because we know that and lots of people have that experience, that's kind of universal at this point, we can preempt it. So you probably got a drawer full of skincare devices that promised everything and delivered nothing. Here's why none of them worked: they sat on your skin, they

never got under it. Cures Micro needles create channels that let the serum reach the dermis, the layer where aging actually happens.
So now the customer hasn't had the opportunity to think, it's just another device because we called that out ahead of time. We've beaten them to the punch, and now they're like, "Wasn't expecting that. I can see where they're coming from."
So the customer's now thinking that explains why the others have failed. This one's different, and it's explaining it through the mechanism. Okay, so copy strategy by objection categories and expert.
Trust. If it's trust, it's fairly obvious you want to stack proof early, you want to explain the mechanism in simple terms. Try and use an analogy if possible. It's like this because it's very visual, okay?
Show the science. Don't claim it. So if you can use GIFs, if you can use good little mini explainer videos, and you're trying to say to people, "Here's why this works when other things don't. We're different, we're unique. Here's our system, here's how our mechanism works."
That's why we can give results when other people couldn't. The second one is identity. Okay? So let the viewers see themselves. The ad should be a reflection, not necessarily of how they look, but of what they're thinking.
So use like subgroup identification, reframe exception as wrong approach. It's not that you're different, it's that you've been taught the wrong approach. If you're very specific with who you talk to, then they all go. That makes sense to me.
So you want to lead with self-recognition? If it hasn't worked for you, it's because it wasn't designed for you. It's not you. You are not the problem. Your approach is your product. This is how we have tailored something specific to you.
Then if risk is the issue, then you want to lead with a guarantee. You want to frame trivialize the price by framing cost as price per day or price per use or price anchor against something that's much more extreme cure. Do this very effectively. They price anchor against clinic treatments. Now, the cure micro infusion device is a premium product, but is a drop in the ocean compared to a full-scale regular appointment sort system for clinic treatments.
So offer them the guarantee. 30 nights, 30 days, right? 30 is kind of the ballpark minimum, but 90 I've seen working really effectively, and that gives people real time to try a product properly. You just have to be very careful how you phrase your returns policy, okay? You don't want people sending you back saying that's been used up and broken because they've been whatever.
So here's an objection map for your product. So if it's too expensive, I don't see why it's different as trust, right? So mechanism. If it's not for me, it's that idea I am the exception. Yeah, I'm sure it works, it just doesn't work for me.
It's an identity thing, help them recognize themselves in the ad. Does it work? I've been burned before, my trust is low. Show me some evidence, show me before and after, show me things that prove to me that this works and it's worth my time. After I've been burned before, I'll think about it, right? Something feels off. It feels risky. I would go with dealing with risk as the category and adding a really strong guarantee. I would ensure... I think about it that there is a level of urgency built into that.

So talking about... Look, the longer you leave this problem, the worse it's going to get, the more you're going to dislike your appearance and how you're going to look and all these kinds of things, so you can dress it that way as well.
So a good kind of practice is to fill in at least five objections for your product, and then that becomes your reference map when you're writing any piece of copy. These are the things that I see.
So how do I address them ahead of time? What are people telling me? What am I learning from what's going on? So the takeaway from module 7 is to answer the real objection, not the stated one, because the real one is where the conversion lives. The service level one won't get you very far.
That is module 7. Hope you enjoyed it. I'll see you guys in module 8. Take care.

Transcript 8

David Briggs | 00:00
Welcome to module 8 of version 2 of the Econ Architects copy. Today I want to talk about building an avatar that actually changes your copy. There are a lot of misconceptions around what an avatar is. Sometimes it's called an ICP ideal customer profile or an avatar. It means the same thing.
So what is it? So 90% of avatar documents, particularly the ones you get from creative agencies and or ones that you make on AI, they're just theater, right? Someone fills out a template. They give the avatar a name.
It's like Sarah. 34, a mom of two. Here's her household income. She's interested in wellness, and it's just decoration, it just sits there. I mean, that could apply to lots of people. It tells you nothing about who the person actually is. They write copy like it was written for everyone.
So when you try to appeal to everyone, you actually appeal to no one. The reality is that there's a weird emphasis on demographics and not enough put on psychographics. The psychographic is about how the person thinks, how they identify themselves.
So the example that I always give in terms of demographics and psychographics is one of my best friends. One of my best friends is a guy called Wang. He's six foot three, about 120 kilos, so he's a really big dude. He's built like a line backup, big Roy player. He's second-generation Jamaican.
So in terms of our demographics, we would look very different. However, our psychographics we're both degree-level educated, we both have two young daughters, we both enjoy fitness and wellness. We both need to lose some weight and want to lose some weight.
So psychographically we're very similar. So the demographic can be misleading. An avatar is only useful to you if it changes how you approach your copy, and that's fundamental here. So demographics tell you the "who" sometimes if it's done well, and the psychographics tell you the "why".
So the demographic might say age, gender, income, location, all these factual things. That's demographic, right? If you will do a consensus, it will be demographic information that is factual that you can't deduce a lot from it. Whereas with the psychographic, you learn much more about who that person is, what they believe about their problem, what they've tried and failed, and why the story that they tell themselves.
Right? I often got much better at this since I've been working with Matt. But I always used to say I didn't have enough time. That's the story I kept telling myself. There's not enough time.
The reality was, I was investing my time doing low leverage things instead of high leverage things. So this is what writes'll copy, the underpinning belief that writes your copy. So here are three things that really matter.
If you can nail these down about your audience, your ICP, your avatar, you're going to fundamentally improve the quality of your copy in a way that will blow your mind. So the first one is identity.
That's about how they see themselves, not demographic, not what they are, but how they see themselves. What is their concept of themselves? Are they someone who takes control? Are they someone who's been let down? Are they someone who believes they should know better? I'm one of those people that know better people.

I know what I need to do to lose the weight, but I'm just not doing it. Identity determines what kind of trigger words and trigger emotions are really going to get under their skin and make them listen. The next is their belief system.
So what do they currently believe about a problem and solution and what are they right about and what they wrong about? So what do they think causes their problem? What solutions have they tried, what they learned from them? Why is nothing worked for them, that kind of thing.
So this is particularly important if you're in a busy market saturated market to help you stand out because a lot of people will be burned by us. They have tried a lot of staff and been disappointed by it.
Then what's the story they tell themselves? The self-narrative, right? I'm too busy, that's me. I've tried everything. It's genetics, I'm never going to look a certain way. I'm not the type of person who spends money on this. This is the reason they haven't bought from you yet.
Your copy either reinforces that belief or disrupts it, challenges it in the right way, and you nail those three things. You can make a massive difference to the quality of your copy. So here's the same customer, but we have two very different avatars. My phone's going mental, so please ignore it.
So the template avatar is that Sarah, 42,80, that these are all factual things about her, but I can't learn a lot from that. The working avatar is she sees herself as someone who should have figured this out right now. She prides herself on being put together. Her belief is she thinks that products she's tried to find a skin doesn't respond like other people's. She's the exception, and the narrative that plays in her mind is, "I've spent hundreds on skincare and nothing makes a real difference.
Maybe this is just what 42 looks like." So the first avatar produces that generic copy that GPT or Claude is going to spit out when it's not called guidelines. The second produces copy that makes when your customer's watching the video, they're like, "My God, this is it. They really get me. They're inside my head."
That's what we're coming for. So here's a quick example, right? So if we use the Cure Micro Infusion device, for example, like from the template avatar, we get tired of aging skin. Your Micro Infusion system delivers clinical results at home. Smooth wrinkles boost collagen. Get the glowing skin you deserve.
Right. It's not terrible, but it's safe. It's saying, "Me. It's predictable." From the working avatar, our psychographic-focused avatar, we get, "You've done the research, you've bought the serums, and you tried the devices, and your skin still looks the same. Here's what nobody told you those products sat on your skin. They never reached the layers where aging actually happens.
That's not a new problem, that's a delivery problem, and it's exactly what Cure was built to fix. That is like being inside their head. My God, they get it. Yeah, I have done that and I have tried those things, and I do think that this is the missing piece of my puzzle. This is how I can progress and move on from this.
So obviously, in order to find the psychographics, you need to know where that real data lives. You've got the review analysis for module six. Absolutely do that. The emotions, expectations, the phrases you've pulled, super important customer service conversations, the questions people ask before buying, the reasons they give you for returning. These reveal beliefs and self narratives direct because this is what people are telling themselves. These are the excuses they

are giving themselves as to why they are or are not taking an action. Obviously, we've got our re forms and threads, particularly the big Mega threads where there are big paragraphs where people deeply describe their struggles. That whole idea of "I finally found something. Nothing or nothing works."

That's the narrative goal, that's the story that lots of people will be telling themselves that you can monopolize on comment sections on competitor sites. What are people saying? That's the language of self-identification.

That's me. I'm like that. Maybe people are like, "You know that doing that thing they put laughing emojis and like that could be me." Well, that sounds exactly like me. Then post-purchase surveys. So ask questions like, "What almost stopped you buying?" "What other things have you tried?" Perhaps, put you off, maybe trying this as well, that kind of thing.

So dig deep. Then John Benson, my pal John Benson, is creating bad-ass high-converting video sales letters is largely about empathy. You need to get into the head and the heart of your market. So the pig method is the punch in the gut method.

The pig method means that hitting that emotional pressure point, hitting them where it hurts because it is so real and empathetic, right? Empathy isn't a soft skill, it's a research skill. You don't just suddenly develop empathy, you develop a better nose for empathy by doing this over and over again.

When you have the research to back it, it's much easier to become empathetic. So what they want versus what they'll admit they want. This is the disparagement that happens between what people say they want or what they really want and what they're willing to admit they want.

So someone might be saying, "I really would like to... I really want healthier skin." That's what they'll admit. What they really want is people to stop asking them if they're tired, people to stop asking if they are okay if they're feeling sick, because that's embarrassing and frustrating and it's basically everyone around you telling you "You don't look very good." I want to feel more energized.

That's what they'll admit they want, but what they really want is to stop feeling like they're falling behind everyone else. They're tired, they're lethargic, they can't keep up with their kids, they're overwhelmed, overworked. I want a better sleep routine.

That's where they'll be. I'll tell myself that. That's why I'm doing this. That's why I'm looking for a solution. In reality, they want to stop dreading waking up at 3 AM and staring at the ceiling. They want to stop the rumination that's going on in their minds where they're just replaying every bad decision they've ever made in their life.

We've all done it at some point in our lives. So your copy addresses the conscious desire on the surface and the unconscious one underneath. So yeah, meet them where they're at, but then show them you understand what they're really trying to achieve, and that's where you can really create a belief shift.

So here's how you can build your avatar in four steps. So obviously, you want to start with your review analysis. You've got emotions, language, and expectations, all of those are in module six. If you haven't watched it already, go back and watch it.

That's your raw material, like your building blocks. Then, from there, you can figure out how to write an identity statement. This is one sentence: "How does the person see themselves?"

That is absolutely critical to understanding what's going on in their heads. Then you want to write the belief statement. That's one sentence. That's where they are and what they currently believe.
For example, "No serums, no matter how expensive, work on my skin." That could be their belief statement, and then write the self-narrative. What's the story they're telling themselves? Maybe there is nothing that works for skin over 45.
It's just the way it is. When you put all that together, you have one paragraph that really defines who your avatar is, what they're about, what they care about, what they need. That will be the backbone of what underpins your copy going forward.
If your copy... The litmus test for this is now you have all those insights. If you write a good paragraph of copy yourself, does it sound different from what you'd normally write?
If it does sound different, you've landed because now you are using those insights to drive the copy rather than trying to guess what people want based on a list of demographic features.
Okay. So you... Deliverables: A working avatar document for your primary customer. You want an identity statement, a belief statement, and a self-narrative. You want a conscious desire, what they tell you they want.
That's normally the surface-level thing. If you're reading reviews, that's what you'll find. Then you're on the unconscious desire, which is what actually drives the purchase. That's the thing they really want deep down under the surface.
Then you'll have that one paragraph of copy written from this avatar to prove to yourself that the document works. And it will, because I do this all the time. So the avatar feeds every piece of copy you write. Going forward is... As I said before, is the back butt is the identity of who you were trying to speak to in ways that they appreciate and understand.
Okay, so once you've nailed that down, make sure you're continually referring to it. Would my avatar care about this? Would my avatar say this? Does my avatar believe this? And keep asking those questions.
Then everything you build going forward is going to be higher quality, more dialed in, and higher performing. Your hit rate will go up. So, long story short, you want to stop writing to demographics and start writing to a person. People are not the sum of the facts about them. They are much more complicated and much deeper.
If you figure that out, then your copy is going to improve exponentially. So next up in video nine, we're going to be talking about market awareness and sophistication in practice. Because there's a lot of confusion about awareness and sophistication. They don't mean the same thing. You need to understand both to be really effective.
So that's what's coming up next. Guys. Speak soon.

Transcript 9

David Briggs | 00:00
Hey, guys. Welcome to module 9 of the V2 Ecomm Architects copywriting course. We're going to talk about market awareness and sophistication in practice. Now, there's a little bit of confusion sometimes about what's sophistication level and what's awareness level.
I know Matt has covered this a lot, but I'm going to give you my take on it, what I think's important from a copywriting perspective, and we'll go from there. So this is really all about understanding your customers.
Okay? So let's get into it. So this is arguably, put my big head out of the way, the most important strategic concept in direct response. Okay, so Eugene Swartz laid this out in Breakthrough Advertising. Most copywriters know about awareness and sophistication, but there are still plenty of people who don't apply it correctly.
Okay, if you need a copy of Breakthrough Advertising, by the way, I have a digital copy. Just message me and request it, and I'll get it over to you. No worries. So the two questions you need to answer before you write anything at all is how much does your market know about the product and how many similar products have they been told about before?
So how much does your market know about your product is their state of awareness? Do they even know you exist? They even know they've got a problem, right? They could be completely unaware. And then how many similar products is about the market itself?
So sophistication is about the market and awareness is about the customer. Okay, so if you get these wrong... This is why people who don't bother to learn the skill and they just go and copy other people. They see an advertorial that looks good and they try and copy it.
It's white, it flops, right? Because that advertorial might work great for that brand because that brand bothered to make sure it fits the awareness level and sophistication level of their audience. However, when you grab it and you just shove it into your funnel, it's not at the right places for those.
So that's where there can be a disconnect and that can cause the issue, right? So if you get them right, then average copy can be phenomenal, right? You can take it up a real level.
Hey, guys, and welcome to module 9 of the B2 Ecomm Architects copywriting course. This is about market awareness and sophistication, okay? So really, it's about understanding your customer, where they're at, what they know, that kind of thing. Now, this is notoriously confusing, where people confuse sophistication with awareness and awareness with sophistication.
I know MAP does a lot of education about this. So you're probably already much better informed than most people. I'm going to share my take on it from a copywriting perspective and why it's really important to nail this down.
Okay, so first of all, it comes from Eugene Schwartz, who's like, let's say, the godfather of marketing at this point. What he said then in 1966, which is, I think, when England won the World Cup, still holds true now.
So most copywriters know about awareness and sophistication. But even copywriters that are doing this day in and day out, they still make mistakes, they apply it incorrectly. So what's the difference between the two?
So first of all, awareness, okay? Awareness is to do with your customer. How much do they know about your product? They could be product aware where they know your product and

maybe they're looking at your products and a couple of other competitors, or they could be completely unaware. They could not even know your product exists. They could not even recognize and understand they have a problem.
That's awareness is to do with the individual. Sophistication is to do with how many products, similar products, have they been told about before? So this is to do with the market. So on one side you have the customer, on the other side you have the market.
For example, if we were talking about skincare, serums, there's a very high level of sophistication. This isn't a new thing to market. There are lots of people offering serums, so the sophistication for that kind of product is very high.
Okay, so if you get these wrong, the copy can be phenomenal. And this is a really important thing. Really good copy aimed in the wrong place will fail. An average copy aimed in the right place will win.
This is why you'll see ads all the time and get hooked or whatever, right? You look at ads and you go, "This is a really mediocre ad. How is this possible?"
It's probably because it is dialed imperfectly to their audience's awareness and sophistication level. So even pretty mundane, middle-of-the-road average copy can do really well when it's put in the right place.
So if your prospect is aware of your product, your headline starts with your product. If he is not aware of your product, but only of the desire itself, your headline starts with the desire. And that basically means you need to meet them where they are.
If they know about your product, start with your product, start differentiating it. Tell them why it's different. Tell them why it's better if they only know about what they want to achieve. Then you need to start with that, right? You need to talk about what they're trying to achieve in their life. Do they want to have fewer wrinkles? Do they want to have visible apps? What is the goal they're trying to achieve? Let's start with that, and then we'll build into that later on once they understand how to achieve it, how the product helps them get there.
Okay. So the same product needs different copy depending on the awareness level. That's why it's really important that you understand the awareness levels properly. So here are the five levels of market awareness. Remember, when we're talking about market awareness, we're talking about the individual customer themselves.
Okay, so unaware they might think everything's just fine. This is just how it is. I'm gonna get sore, I'm gonna get tired, I'm gonna... That's just my life. I don't see that there's an issue, right? They might not be happy with it, but they're not seeing it as a problem.
So you need to educate them about the existence of a problem. Lead with emotion or tell a story. Nobody tells you this about your skin after 40, but actually, you don't have to accept wrinkles and that kind of thing.
If they're problem-aware, then that means they understand that they have a problem. There is something that makes them unhappy that they see can be fixed in some way, but they're not really actively seeking any solutions right now. They're just unhappy about something. A big segment of the market is in the problem-moreware category.
So validate the problem. Do you know what that is? A real thing. What you're thinking, what you're dealing with, that frustration that you have, it's real and something can be done about it. You start to introduce the solution category if your skin looks dull no matter what you try, keep reading with calling out the problem we're validating.

Yeah, that's a real thing. Then we're introducing the solution. If they're solution-aware, then they know that there are things in the market that can fix that problem. They might have even started to dabble in some of them.
Maybe they've tried a few things or they've looked into things but not actually pulled the trigger. So solution-aware people, you want to differentiate yourself from what's in the market. You've probably heard about this and this, but they're going to disappoint you, and that's because they don't do XY and Z. Our product introduction, your mechanism, right? Our product does that because our product goes further, our product reaches deeper.
So in the case of cure, most serums sit on your skin on the surface outside, right? This one goes under it. Okay, that's a different solution to the ones that I've heard previously. It's new, it's interesting. I can take it from there, product to where it comes down to right.
I've decided again in the case of cure. I've decided I want to try micro-needling. I just don't know if this is the right one for me. So you need to build trust, you need to stack proof, you need to handle any objections that I might have. In the case of micro-needling, it might be around pain, safety, convenience, all of these kinds of things so you can build... Here's why 12,000 women switch to cure this month.
Then for most aware, these are people who are really ready to make a purchase. You just need to remove any final barriers that I might have holding them back and make the offer. You want to create urgency around that. Make them want to make the decision right now so you can give them a really good strong offer, a really good guarantee, and a time frame. This isn't going to be around forever. You need to go now, right now. The five stages of market sophistication. Sophistication is not awareness. We're not talking about a customer level, we're talking about the actual market itself.
Okay? The way to think about it is like an actual market. If you went into a town and they had a market and you're there and you want to sell, I don't know, tomatoes, right? If you're the first person, they're selling tomatoes, you don't have to do anything, right? You can just say, "These are fresh, juicy, sweet tomatoes."
That's it. You just say the simple thing you're not competing with anyone else, you're in a blue ocean. So, yeah, first, the market is stage one. No one else is saying anything yet. Stage two is when competition arrives.
So again, my tomato example. Someone sets up a store next to you and their tomatoes look the same, so you have to now outdo the person next to you. These are the freshest tomatoes in the whole country. These are delicious. They're sweet, they're juicy, they're full of vitamin C, they're great for you.
Okay, you need to make a bigger claim. It clears acne in seven days. It becomes stage two, it becomes a battle of who can make the biggest claim, who can promise more. But that very quickly gets old and boring because when everyone starts making bolder claims, the claims start to get ridiculous. You look 20 years younger.
You reverse the sign of wrinkles overnight, these kinds of things. Because you've seen them. I'm sure you've been through some accounts where you've just seen the most absurd claims about what male enhancement pills can do and so on and so forth.
All trust is gone. So when you get to stage three, you need to move beyond just making big claims because no one's listening to them. Everyone's out there shouting big claims. Now you need to have your new angle or your mechanism. This is how you differentiate yourself, so how

are you solving the problem differently? It was my tomato stand. It could be about how those tomatoes are grown. We only use organic soil, we use this very specific type of seed.
That's why that's our mechanism, that's what makes us different from all this noise. It's not about that, it's about the specifics of how we develop our product. So in this case, it could be like the reason your acne keeps going back isn't bacteria, it's your moisture barrier. I'm making a mechanism claim, right? I'm not just shouting louder, I'm showing a different reason, a different why behind their problem. Stage four is peak saturation.
So again, you'll see this a lot because this is what happens in e-commerce. Someone works extremely hard to come up with a great idea. Someone else jumps in and just goes, "I'm just going to copy that and might just take it for myself." Sadly, that's the world we live in.
But that's what we've got to deal with. So if your angle, your mechanism, gets copied, you need to amplify it. And what do I mean by that? So let's say you were selling a micro-negliging device, and someone comes in and basically steals your micro-negliging device. Or you can still outdo them with proof, with more specificity, with more stories, you can explain how, with expert testimony, how your product is the real deal when there are a lot of fakes and copycats out there.
So you need to amplify your angle, you need to make it stronger and back it up. So when people go, they're saying this and they're saying this, but hey, these guys have dermatologists back in them up, they've got real trust pilot scores, they've got real business efficacy, they've got great customer service.
That's the brand I want to go with. Then, if you were in an exhaustive market where there is very high sophistication, you get to a point where no one believes anything anymore. Basically, they don't believe the promises. They don't believe the mechanisms. They all think it's nonsense. You have to win through identification.
So how does the person identify? From there, you need to shift their way of thinking to... It's not that the products don't work, it's that those products work for certain people. They just don't work for you.
But this one does. It's a reframing of where the way they think. So this one is built for your skin type. That is why this one will work for you. We'll explain exactly how. We call you out specifically. Your problems, your fears, your concerns.
You make that person feel sane. So awareness determines your funnel in many ways because there are certain things I wouldn't do in certain funnels. If I had, for example, a product-aware customer, I wouldn't bother giving them a problem-aware VSL because they already know that problem, they know what solutions are available, and they're close to making up their decision. I wouldn't do that. I wouldn't have such an extended, prolonged funnel because I don't have to shift them through the stages of awareness.
So if it's an unaware or problem-aware audience, you can do an ad to an ad VSL or an advertorial and then a PDP. An unaware or problem-aware person needs education. They need to be moved along the funnel, they need to understand they have a problem, why they have that problem, why nothing else that they've tried has worked.
If they've tried anything, what solutions are available to them? Then they need to understand how your solution is the best option if you send aware or problemware people directly to a PDP. Most of the time, they're just going to bounce straight out because they don't connect what they've watched, where they don't really even know if they've got a real problem yet to this

product. At the end, there's a huge chasm of education that gets them from point A to point B solution aware. They know solutions exist, but they don't necessarily know about yours.
So the advertorial. So I would do an ad to an advertorial to a PDP and list the calls work really well for solution-aware audiences. They know solutions exist, but they don't know about yours. So it's all about differentiating yourself from the other solutions, the more common ones they might have seen, and introduce your mechanism.
Okay? That's really what you want to do with the solution, and where audiences educate them, teach them about how yours works. Why it's different. Why they can expect better results, and then product-aware, most aware, you want to send them directly. They're already quite advanced in their awareness stages. They know you. You just need to prove to them you're the right choice for them.
So lots of proof, make them an offer, remove friction. You don't want to go through long education, because what you then do is send them back so they start rethinking about their problem. All right?
It's like them being right at the finish line, and then you move in the finish line another hundred yards away and say, "Hey, you got to start over again." That's going to irritate a lot of people. That's not what I was going to say, but it's going to irritate a lot of people. So case study for premium athletic socks. Let's take a look at this one. So the wrong awareness match here was add direct to PDP and check out.
So the customers were solution aware, not product aware. They didn't understand the patented blister prevention technology. So because they didn't understand that the price seemed really high for socks, right?
This is from Hollow Socks brand. Really good brand for looking up blisters. Now, if you send people directly to a PDP before you've educated them on a premium product, they'll be like, "Well, why am I paying $50 for socks?
That's crazy. I can get socks for $5." It's not going to work, and that's because there's an education gap. Without an advertorial in there to show them why these socks are $50 and how much better it's going to make their hike in there running, all that kind of stuff, they just see a really expensive pair of socks.
However, if you had done it right and you'd gone... Okay, these guys are solution aware, so they know that finding a pair of socks might be the right thing. We need to educate them on why they should choose our socks and how our mechanism is different and better for exactly what they need.
So we could go with something like, "Why 73% of marathon runners develop blisters, and the engineering solution?" Okay, so it could be like cross sections of how they work, comparisons with a thin pair of cotton socks versus these advanced socks with the extra layers and cushioning and Teflon coating or whatever. I don't know. By educating them, you go... Right. That person goes, "I see. This is a real investment in my foot health. This is going to mean I can train more regularly, this is going to mean I can enjoy my runs for longer. I'm not going to have so much downtime. I'm not going to have so many issues. Conversions go up because people understand the value of the product they are no longer in at that stage thinking that seems really expensive, like this is going to really fix my problem. Average order value goes up because people are actually going to get a couple of pets. This is a real investment in my foot health.

Returns go down because when you set clear expectations, people aren't frustrated. If I bought a pair of $50 socks without understanding why they were $50, I'd be annoyed. There's a good chance I'd return those, however, if I knew they were going to solve my problem.
I could get out on the track more, I could train harder, and I could enjoy my runs more without that kind of fear of injury or pain. Absolutely, I would make that investment so the product didn't change and the price didn't change. The awareness match changed. Customers need education in order to make the product make sense, particularly if you're selling something that is premium in a common category, like if you were selling premium reading glasses or something, or blue light blockers.
If yours are $200, but there are $30 ones on Amazon, they need to understand why yours are so much more expensive than the Amazon ones, because if they can understand that, then they have no problem buying them. People don't have a price problem, they have a value problem. If they see the value in something, they will pay for it. So sophistication in action, right? So a pain relief brand was operating in a stage four-five market. Customers had heard every claim and tried every product. They were burned out.
That's why they called. Stage five is the exhausted market. So what competitors were doing... So a lot of competitors were doing stage two-three kind of copy. So they were making big claims and leading with mechanisms in a stage five market by it.
So it was just getting drowned out. Customers basically switched off. They stopped believing it. So what you need to do first, if you're in stage five, is identify them. You haven't failed to find the right product, you've been solving the wrong type of problem. We need to shift your belief system. The product is all there. They're all making the same claims, but we are different because this is designed specifically for you.
It's identity, okay, education through advertorials where you can walk them through every kind of diagnostic they've tried before. That was wrong. You've probably been wrongly diagnosed with plantar fasciitis.
It's not that everyone says that when it's foot pain, it's plantar fasciitis. They use these big, broad stroke statements. Plantar fasciitis is actually relatively rare. This is what's probably happening instead. This is why it hasn't worked for you.
It's about identifying the person behind the problem. This is a real case study. Got a 5x ROAS on this, and it scaled very hard for this brand because we went to an identity claim rather than sting down here and competing with everyone else trying to pull out random unique mechanisms that were overengineered and worthy and ridiculous, to be honest. How do you diagnose your market?
So how new is your product to the marketplace? If it's very new, you probably have low awareness. Can customers name competing products? So if your customers are aware of competing products, then they're going to be solution-aware.
If they can name your product, then they're product-aware. What questions does customer service get? How does it work? Which bundle should I get? If it's how does it work? You can tell straightaway they're at the low end, right? They're like, "Right, I know I've got this problem, but how does this thing solve my problem?"
If they're talking about which bundle should I get, do I need the dark spot and wrinkle serum, or do I need both? Or should I use one, or should I alternate or whatever? They're highly aware. How many similar complaint claims have competitors made?

So if you've got a few competitors making similar claims, you're probably at the lower end. Most of you guys are going to be in the middle, three, four. If there are a bunch of them, then your market's going to be very cynical, and you need to really focus on identity.
Then what do the two-three customer sorry, two-three competitor reviews say? If they're saying it didn't live up to the hype, then going back to our diagnostic tool, it means that they were left disappointed.
So the competitor probably overpromised and underdelivered or they didn't educate enough on the value of the product. So that person feels like they have overpaid for something, which means they did not see the value in it.
If your competitor review center, everyone's always saying the same things this and this, then you're at stage five, and you need to go to identity marketing. Then what happened when you ran a simple benefits at...?
Okay, if you just did a problem-agitate-solution where you just focused on doing a simple benefits stack, if it worked and it did really well, you've probably got low sophistication. If it flopped despite having a really good product, then it's not enough to move the needle. They've heard it before.
So here is a quick diagnostic for this part of the course. So write your product one to five on each factor, right? So price point, category familiarity, complexity, visual impact of results, and technical differentiation.
If it is low, like you've got a low-priced product where it's really obvious... I'm talking like a TikTok-trendy thing, a new lip gloss or whatever, where the transformation's really obvious, benefits are visible.
It's cheap, it's affordable, whatever. You can just send them straight to the PDP hook them with a good ad. My god, this looks so great. You can send them to PDP if you're in the middle of this, when you figure it out where it might be a higher price point and maybe it needs some explanation and there's some technical differentiation that needs to be made. You're probably going to need an editorial to do that education and create that bridge between those two components.
If you have a more complex product or a product that has a much higher price point, something needs a lot of explanation where the benefits might not necessarily be really obvious to start with. Then a VSL can work really effectively here, where you can educate people on the system, how it's working, what's going on inside, and all of that.
So it's just a ballpark idea of how you can break it down. So yeah, what you want to do is a completed market diagnostic for your brand, your awareness level of your main stream of cold traffic, the sophistication stage of your market, your kind of scoring guide, what funnel is going to be a good fit for you, and then what that means for your next app.
Okay? When you have those components, a lot of people ask me what sort of advertorial should I do? When you have these things, you can figure it out for yourself because you know that they're this sophisticated. There's this awareness. I need to leave it
like a mechanism-focused laboratory. Okay, figure that out, and it's going to help you focus your copy and streamline your copywriting process so you're much more dialed in and much more likely to hit a win with your final.
The takeaway that I keep setting right is, "Meet them where they are, not where you want them to be." If they are unaware, if they are problemware, if they are low down, help them along the

journey. Meet them where they are. Educate them on the consequences of the problem. Introduce the solutions. Give them the real underlying reason so they have something to hang their belief on to build hope, and then present your product as the best way for them to achieve their goal.
It is the correct solution for them. Then give them a compelling offer that's so good they can't resist it. Okay, module ten is up next, and we are talking about choosing the right... Desire to see you there.

Transcript 10

David Briggs | 00:06
How do we feel about video intros? Okay, the.
How do we feel about musical wintros? Welcome to module 10 of the V2. We are talking about Desire, in case my little tune didn't give it away there. Choosing the right Desire is really Important.
And that's because if you go for kind of something that's saturated, you'll compete in a really complicated way. You don't have to do that. You can find the Desires that kind of underserved in your market and speak to those.
And that's what we're going to be talking about today. So let's get into it. So every product can be sold on kind of multiple Desires, right? No product or very few products only serve one Desire. A sleep supplement could be sold on energy or health or vanity or fear or comfort, right? A skincare device could be sold on aging, confidence, routine, status control. The problem is that most brands kind of automatically default to the most obvious, and because they do that, everyone's doing that.
And you end up competing with brands selling similar products on the same kind of driving. Desire. And that makes your life hard. The breakthrough comes from choosing the Desire that's kind of underdeserved in the category, but is still very much alive in the customer. This works a lot for the supplement market. You've heard me use these kind of examples before.
So for example, the creating supp creating market Creatin is a very proven supplement. It's real, it works, it does what it promises. Previously, the Desire that was driving it was for gym gangs. Jim Success, right? That it was kind of vanity and strength and those kind of Desires.
However, now there's New emerging markets for creating like people who are on the GLP one weight loss injections and they are looking for like preservation. They have fear of muscle loss. So it's an entirely different deire same product, completely different approach, completely different market.
So it's a strategic choice, not necessarily a creative one. So you're making this decision of which Desire you want to approach or which maybe handful of Desires you want to approach before you start creating a copy. This is done ahead of the copy creation process.
So there are three criteria for selecting Desires. So the Desire that scores the highest across all three is your lead Desire. So first of all, it's the emotional charge. So how alive is this Desire in the customer?
Is it something that keeps them up at night? Are they constantly thinking about it? Is it something that's on their minds all day? They can't focus at work. If it's got a really strong emotional charge, then your copy has to do less work because you're not trying to convince them of this. You're channeling that really strong Desire they already have. The next is market white space, as I call it.
So how underserved is the Desire in your category? So if everyone's leading with the same Desire, then you end up with a space that's really crowded. Your ad becomes one of a dozen seeing the same thing. We've discovered that with a few supplement brands I've been working with recently that the top five Desires are so oversaturated you can't make a dent in what you're trying to say to these customers.

So we have to find a new Desire that we can tap into. Okay, that's your opening the new Desire and then product credibility. Okay? This is about how strongly can your product deliver on that Desire. Can it actually fulfill the Desire that they're speaking to?
If it's over promising or the connection between your product and the Desire is really thin and it's hard to believe you're going to end up with copy that's forcing a square peg in a round hole and then a high return rate because people are going to be ultimately disappointed.
So that's just something to bear in mind. So how does it work in practice? Let's take your micro infusion as an example here. So here's some potential desire. Okay, potential desires are aging wrinkles clinic results at home control over routine, being seen and noticed, not falling behind. Okay, so the emotional charge for those anti-aging wrinkles is a high emotional charge. This is something that does keep people up at night. Their appearance, worrying about looking older, worrying about being unattractive to their partner and what passed their best. The problem with the anti-aging and wrinkles angle is there's not a lot of white space because there are a lot of different competing products, not just directly, but within that niche. They're all making the anti-aging wrinkles claim.
Yeah, it has high credibility, particularly with a device like yours. It can deliver on that promise. But it's a crowded market. So we can make the assessment that we could force our way in there and outdo people with our credibility and our ability to deliver on that emotional charge, but we'd be making life hard for ourselves. Clinic results. I hope it's not a strong and emotional driving force as anti-aging.
Okay, there is obviously a lot of frustration, there's fear around the cost. There are fewer people making that kind of claim. Yeah, absolutely it is credible cure microfusion device. It's not a replacement for clinics, but it's a great intermediary product.
If you've tried topicals and have been disappointed, but you're not ready to make the leap or can't afford to make the leap to professional dermatology services. Control over routine. Okay, so yeah, there's emotional charge there. People want to feel in control and not be bound to things. There's white space.
It's a strong position that we could take. But is it enough of an emotional charge to drive people to take action? That's what we have to answer. It's good. So being seen and noticed, huge emotional charge. The idea that as we get older, we particularly women, I've done a lot of customer surveys and customer reviews with women who feel like once they get past a certain age, they become wallpaper. They feel invisible. They used to be noticed and get attention and all of that.
Then suddenly they get to a certain age and that disappears. That's a horrible... That's not a nice feeling to have that feeling that you're past your best. There is white space there, but it has to be dealt with very delicately.
Yes, again, we can credibly deliver on that result. So it's a strong angle and definitely worth exploring. Then there's the idea of not falling behind, and I'll go into a little bit more detail about that in a minute.
But there's a lot of emotional charge about not falling behind. There's a lot of white space because it's an underexplored idea, and it's very credible. So this would be our kind of winner based on these criteria.

So anti-agent scores high on charge and credibility, but there's no white space if everyone's competitors are leading with that, then you're trying to push your way into some a very busy marketplace.
Again, if you go back to my previous example and you think about it as an actual marketplace, imagine there are all the different stores there and you're all trying to shout the same message. They all blend into one another. Whereas if you're the person who's shouting a different message that resonates with people, you're going to get attention.
That's a way to think about it. So whenever I say the market, try and think of it in terms of a physical market because that makes it way easier to understand how important messaging is because the voice that is different, that can deliver on the promise, is going to be heard in that space.
So what changes when you choose the right desire? So if we are leading with anti-aging, we've got reduced wrinkles of fine lines, cures, clinical-grade micro-infusion systems, smoother, firmer, younger skin.
It's nothing wrong with it, and the product is able to deliver on that promise. But the problem is it sounds like every other skin care. There's nothing that's really differentiating it. The customer's going to overlook this scroll past this because they've heard it a hundred times before and they're not being told or educated on why Cure is different because they're just hearing the same message and not giving Cure a chance to do that.
However, if you're leading with the whole idea of not falling behind, it can be something like you can tell when you've stopped. Your skin tells you, the mirror tells you, and the truth is, once you see it, you can't unsee it. The question is whether you need to do something.
It is whether your question isn't whether you need to do something. It's whether what you're doing is actually reaching the layers that matter. Compare if that's paired with the right visuals that are doing visual storytelling. This stops the scroll.
It's speaking to something real that nobody else out there is saying. So the same product. The first version is in that messy, loud, complicated, and busy space. The second one is starting a new conversation fresh.
Still speaking to a desire. But it's speaking to a different desire than the first one. So again, going back to my case study. Because it makes so much better sense to use real examples from real success stories.
So the obvious desire for this men's skincare brand would be to look better. But every competitor was selling this idea of aspiration, better skin, a younger appearance, and being more attractive. It just became white noise, background noise. The insight from the reviews told us that repeat buyers weren't looking to look better. They were buying because they noticed when they stopped.
So it was to prevent reversal, not to accelerate towards this goal of aspiration. The real desire was regression avoidance. I don't want to go backwards, I don't want to fall behind, I don't want to be like, "Look great."
Then suddenly feel like I look like a granddad again. I want to maintain the version of myself. I've spent this time cultivating this look, this persona, and this skincare routine. I want to be that guy.

So it's identity maintenance and not improvement, and that's a very big shift. So we stopped selling improvement in the emails, and we started speaking to that control aspect. You're not the kind of guy that lets things slip.
You know this works. You need to stay on top of this, otherwise you're going to start going backwards. We're not worried about going forward, but you're going to start going backwards. When we changed that messaging, we saw a huge bump in email performance. 97% revenue increase, which is insane.
Then the total of 1.26 million total attribution. So you can see how much the email shift contributed towards that. It wasn't because we were sending more emails, it was literally because we were choosing a better approach to speak to our customers. We were selecting the right desire, the right kind of emotional driving force behind it.
So you'll hear me say this a lot if you've been in any of my calls. There is something called the rule of one. The rule of one is very simple. Everything you present into your marketplace, in your copy, or everything should follow one rule.
So one primary product benefit doesn't mean your product doesn't have multiple benefits. But there is one primary one, and the other one supports it. If you don't know what that is, you might run into where you test this one as the primary one, and this one is the primary one.
You go, "Wow, people are really responding to this. Let's double down on this one and use the others to support it." You should have one emotional appeal. The entire piece of copy should make the reader feel one thing, not a mix of fear and excitement and urgency and comfort and all of this,
right? Because cycling through your emotions is exhausting. It's tiring. People don't want to do that. If you think about a time in your life where you've been really happy and then really stressed and really fed up within the same day, you'll know how mentally draining that is. You don't want to put your customers through an ordeal, and they should have one clear call to action. You don't want to have "learn more" shot now.
So followers, all these things all at once. So you'll know that I'm sure Osh will speak about this in his course. The call to action should just be really clear. What is the one thing you want that customer to do at the end of this? Is direct response? We need to tell them what we want them to do.
They should have one argument. So every sentence in the copy should advance that one argument towards a conclusion. If we were talking about progressing through the stages of awareness, problemware, solution-aware, we are just moving them through with that one kind of story, that one kind of... This is where you were. This is why it didn't work. This is...
It's logical, and it flows, and it's simple to follow if you've got sentences in your copy. This is why one of the best skills you can learn is to edit ruthlessly. Because I am someone that still struggles with overwriting, I have to conscientiously review my copy and cut chunks of it out because I tend to overwrite.
If it's not moving the customer forward or providing the customer value, cut it. You need to be really ruthless with it. There's a really good book by Stephen King, the horror author, called Stephen King on Writing.
It's like a semi-autobiographical book, but it's basically where he explains his writing process. One of my favorite quotes from that is, "Write the story and then cut everything that's not the story."

This is exactly what he means. If it's not moving the story forward... In his case, it needs to go. If it's not adding value to the reader's needs, it should go. The same thing applies for your copy. When you try and say everything, you end up saying nothing.
Because people don't know how to feel what they should care about, what they should focus on. It becomes messy. The rule of one forces you to be very clear with what you're saying, what it means to them, and then what they should then do.
So the Default Desire Trap. How do you spot you've defaulted to the obvious Desire instead of choosing the right one? The most obvious one is that your hook sounds like every other competitor. If your hook sounds like every other competitor, you're probably leading with the same Desire as that.
Depending on what niche you're in and that kind of thing, they will just outmuscle you with bigger ad budgets, they will outspend you. They will get more conversions more quickly, so they'll have more trust signals. They will just bully you out of it if you try and compete on the same terms as that. Track number two is does your copy list multiple benefits?
If it lists multiple benefits and gives them equal weighting, then you are not applying the rule of one. You're hedging your bets and going, "Well, this is good and this is good," but it doesn't give them one thing to focus on. What's their takeaway from that?
If you think about when you go to a restaurant, what restaurant is going to be better? The one that does a little bit of Indian food, a little bit of Thai food, a little bit of Chinese food. You can get a cheeseburger there or the authentic Italian restaurant that only serves authentic Italian food. When you are specific, the perceived value of something goes up.
So when you're messaging is specific and you're speaking to one Desire, people will see greater value in your product because you're not trying to solve everything. You're saying we're doing this thing because you've got this problem, and we fix that problem. Number three is, "Do ads perform fine?" They're okay. They're ticking over and floating by, but they never have a breakout moment.
That's probably because you're in a crowded space. Adequate results or Mediocre results. They come from that obvious desire. The real runaway train ads are when you find a new desire to tap into.
Matt, I believe it was Amy who came up with a really good runaway train angle that we're speaking to a different desire. If customers say, "I've seen this before," then obviously the desire you're writing...
It's been seen so many times that you're not even getting a chance to differentiate yourself because they're just automatically going, "Yeah, I heard it all before. Yeah, I'm not interested." If you're click-through rates decent but your conversion rates weak, then your hook is working, getting attention, but the body doesn't connect deeply.
Okay, so the desire might be surface-level though. Going back to it, how deep is that desire? If we go back to my table here, what's the emotional charge? How deep is that emotional charge running?
If it's not enough to get people to stick around and we go... If it's not enough to get people to speak about it, it might be too surface level. You might need to find a desire that has a deeper emotional charge.

So the selection process. So list every desire your product connects to. Okay? You can do that through your Life Force 8 mapping in module 5. What Desires is it speaking to? Most products typically connect between two to three to five strong desires.
If you've got a single function product, like it only does one thing. I don't know. A pair of boots or ski goggles or something, right? You might find that slightly harder, but you should still be able to connect.
So score each on those three criteria. What's the emotional charge? The market white space, product credibility. It's really easy to find these. The emotional charge comes from your research that you've already done.
Module five, how deeply do people care about this, right? Market white space. If there's a bunch of competitors already using it, there's not much white space. If no one's doing it, there's lots of white space and then product credibility. Can you deliver on that?
You need to be really honest and ruthless with it. If you've got high emotional charge, but it scores low in white space, you're going to find it difficult to really make your claim in there because there is clear, raw emotion driving the decision, but everyone's saying the same thing. You're going to find it hard to stand out.
So you want to check your competitors. What Desire are they leading with? If they're all leading with one, you don't need to get in the mud with them, you can go right, cool, you guys own that Desire, that's fine. Go ahead.
Unless you have a unique mechanism that creates genuine differentiation. This is why the anti-aging, wrinkle, anti-aging, and anti-wrinkle angle has worked for Cure. Because Cure we were able to bring a new mechanism into that very loud space. Completely differentiate themselves through the system, and then you can cross-reference it with your review analysis. You watch module six, if not go back and watch it. You want to map the Desires to the Strongest Emotional Language.
So what are people actually saying in their own words about their problems? About what's keeping them up at night and that kind of stuff? In order to make them connect those two components.
If you see really angry, aggressive, or emotional language, what is that based on? What's causing that? Where does the... Map to that and how do you connect those pieces and how can you use it and then lock it in and commit?
Okay, so choose one of the strongest ones based on your analysis of the matrix that you've done. Then write the Desire as a single sentence. The sentence becomes like the compass for every piece of copy you write after that until you're ready to test a new Desire, a new angle, that kind of thing.
Okay, so for example, you can use this prompt to map your product against the eight life force eight got there in the end and score each one accordingly. So the prompt is "Here is my product and then give Claude the description, features, the mechanism, and here are my customer reviews paced in like 2200 somewhere around there. Here are my competitors' angles."
Then give them your five biggest competitors or potential competitors. Then map this product against all eight life force Desires that each Desire score one to five on emotional charge. How strongly the customer feels about this white space, how few competitors leave this, and product credibility. Identify which Desire has the highest combined score. Explain why, then write a one-sentence Desire statement I can use as a compass for all my copy.

So AI can do the mapping, but you make the final call. Maybe there are a couple that are close, and I think this one's got a lot of potential. Okay, but it works because you now understand the framework.

Because you understand what you're looking for and trying to identify. So all I is doing is figuring out. Because you've given it the guidance in order to be able to do that. So here's what you should have right. All your potential desires listed, the three criteria scoring for each one, your competitor desire audit.

So which desire? Your top five competitors are leading with your lead desire locked in. So you figured out the one that scored the highest, and you've got it written as a single sentence. And then the final step off that is to write a short ad or a piece of copy written from the Desire as proof. It produces different copy from the obvious choice.

It's super important that you can see these things. What I'm teaching you here actually works. The only way to really do that is through producing something, creating a piece of copy. It could just be a single, a simple 45-second ad.

But when you've got it dialed in, you're like, "This is the Desire I'm going to speak to." Because of all my research and what I know, I can confidently say this is going to work. Your copy will change. It will be completely different to anything you've written before, and you'll be like, "I can really see the difference here."

So what's the takeaway from Module 10? Module 10 is, "Don't lead with the obvious Desire. Lead with the one that no one else is serving." Because that is your window of opportunity. If you do that correctly, you can own that Desire. You can be the brand that speaks to that specific Desire.

That is a very powerful position to take. Okay, up next we have Module 11. Unique mechanisms that are actually real. I'm not talking about just calling it like "time reverse serum tech," blah nonsense, right? We're talking about how to develop a unique mechanism and use it effectively in your marketing.

So it's really worth checking out because the amount of mistakes I see around unique mechanisms is crazy. So see you in module eleven. Take care.

Transcript 11

David Briggs | 00:00
Welcome back to my office for module 11 of the new ECOM Architects copyrighting course. We are talking about unique mechanisms today. Let's get into it. I'm going to pop my head up there so I'm not in the way.
Okay, so what's a unique mechanism? Well, the unique mechanism is how does your product deliver the result in a different way to everybody else? That is critical. If you are at stage three or stage four sophistication, bigger claims aren't going to cut it anymore. You need to have a unique mechanism.
If you're in stage two, it's very good to have this ready for when stage three comes crashing it. So it's one of the most powerful things you can do in direct response because it bridges the gap between customer skepticism and their belief, and we're trying to close that gap.
I'm not sure if this will work. All right? This has a different way of operating, it does things differently. I understand that, okay? It's the reason customers think this is going to work when nothing else hasn't, okay?
There are three main things that having a really strong unique mechanism helps with. One is differentiation. It helps you stand out from a busy marketplace. Number two is credibility. When people understand how something works, it becomes much more believable.
All right. If you were explaining it to your friend, you're like, "It's got this really cool new thing. This is what it does." They'd be like, "Yeah, but how is it doing that?" If you can't explain that, you're going to feel foolish.
So you want to know the how so you can explain it and hope it gives burned customers a reason to try again. They've probably tried many things. It hasn't worked, so this gives them hope to try something new.
So Eugene Schwartz says the mechanism can be inside your ad to prove your main claim or on top of the ad elevated by the state of your market to becoming the main claim. What means by this is if you're in stage three kind of plus and you're writing an advertorial or something, then you want your mechanism to be built into the headline, right? You want to start off with differentiation. This is why we're different. You've heard a bunch of crap about all this stuff. This is why we're different.
It's not a supporting detail. Okay, so where do mechanisms kind of fall down?
Mechanisms kind of fall down when they're just labels. So they're not actually, kind of underpinning a function of your product. Something that your product does differently, they're just naming, just throwing a name out there and seeing if it sticks.
So that biosync formula, okay, sounds fancy, but what does it mean? What does that do? It's not actually representing a mechanism. It's just a thing that someone has put out there. Triple action technology.
Well, unless there is a mechanism behind it. To explain how that triple action technology works synergistically to create an outcome that they couldn't get otherwise. Again, it's not doing anything. And people that say like patented it's are patented patents are legal protections.
It's got nothing to do with the efficacy or effectiveness of the product, so it's kind of a useless thing to kind of put out there unless you're trying to scare off competitors from stealing from you.

Real mechanisms that convert actually have a mechanistic function. The product is doing something differently to things other people have tried.
So cure, for example with the micro channels. It sits in that gap between clinical brain therapy and topical treatments, right? It is creating microchannels in the skin. That is the mechanism to deliver serum deeper to solve a problem, right? DT blocking shampoo.
It's a mechanism, because DT is the hormone that is often responsible for, hair loss, hair thinning and shedding. So the mechanism is that the shampoo actually has DT blocking components that stop that thing from happening. It reframes the problem as it's not an age thing or a health thing, it's actually a hormonal thing.
And then something like micro nerve targeting pillows. If it had a way of triggering trigger points behind the skull at the base of the spine to promote relaxation, it would be serving a function that a typical pillow cannot do.
Okay. Diagnosis, new solution. The mechanism is bridging the gap between those two things. If you are a student of Stephen Georgie or something, he'll call it the unique mechanism of the problem. I call it that sometimes, but you can call it the root cause or the true cause. What's actually happening, which explains why nothing they've tried works.
How does your product deliver a new mechanism that solves that real root cause problem? That's the way you want to frame it and think about it. Okay, so there are three types of mechanisms, right?
So there's the existing mechanism. So it's a known feature presented in a fresh way. For example, microleading. Microleading isn't new. Clinics have been doing it for decades, but this idea of an at-home microleading device is new.
As I said before, it reduces the gap between super-extreme clinical therapies that are very expensive and time-consuming and topical that can feel very superficial and don't yield results. This is where we see it, and this is why it works.
So is reframing a known technology in a new way to give access to a different community of people. Dyson is one of the best brands in the world for studying unique mechanisms. They have so many great naming conventions and mechanisms for their different products they bring out. One of the most famous ones in the world is Cyclone technology, which is related to the suction. All Hoovers suck stuff from the ground.
That's what Hoover vacuum cleaners do. Well, Cyclone technology makes it sound more innovative. It uses the unique Dyson engines, and they're very good at showing cross-references of how it works and doing lots of "ours versus them" style ads, that kind of thing.
So that's the existing mechanism. Unspoken mechanism is where there's a feature competitors have, but they haven't really effectively labeled it. So they have a mechanism, but they haven't branded that mechanism. They haven't taken ownership of it, which means you can...
For example, a supplement brand, cholate magnesium, right? Magnesium is really good for absorption, but they haven't called it that. They're just calling it magnesium on the label. They haven't taken ownership of that.
Well, you can name it Deep Absorption Chilation and explain why most magnesium never makes it past the gut. So a lot of magnesium is destroyed. Magnesium can't cross the blood-brain barrier to where it's needed, that kind of thing. You can own the angle through the mechanism.

Then there's the transubstantiated mechanism, which is a fancy name for giving a feature that seems ordinary a new name or new meaning. So you're elevating it in some way.
So the feature might be ordinary, but through naming and reframing it, you make it something extraordinary, right? So for example, a shampoo is like micro-foam infusion, which is basically a foaming agent, but because you've named it and explained it in a way that makes it sound super appealing, it elevates the product. One of the other examples I like to give is when Under Armour, the clothing brands first came into the market, they were calling their compression fit like four-way stretch compression fit technology, right? There were other brands who were trying to own the compression fit niche, but they weren't really labeling it with a unique mechanism.
Then, when Under Armour came along back in the day when I was doing retail and stuff, they sent reps out to educate staff that were going to sell this product on the functionality of it.
They had to stretch it, pull it, move it around, try things on, and all this kind of stuff. Back when I was about 40 pounds lighter than I am now. And they really owned that mechanism when they were able to develop that brand. They started off with things like compression shirts, and now they've got trainers, football boots, and all kinds of other things. They've just blown up the huge... They were billions now.
So how do you do the mechanism test? So really, you want a mechanism that passes these six sticking points. So is it specific and easy to understand, right? It's no good if it comes across as marketing jargon.
That's really useful to you, but the customer can't explain it in one sentence. So does it explain how the product works, not what it does, but how it delivers that thing? Okay, is it distinct from what competitors claim?
So what we don't want to do is try and copy their mechanism exactly or claim the same kind of mechanism, because otherwise we just sound exactly the same. We end up at where we started. Does it address a major pain point?
So a mechanism needs to connect to the customer's real problem. Can you name it memorably? Now, if you spend ten minutes on Claude or ChatGPT and you don't understand what a unique mechanism is, it will spit out a whole bunch of things that sound quite plausible but are really just labels.
They're horrible examples of what a unique mechanism needs to do because it won't be specific and easy to understand and it won't explain how the product works and it is it backed by credible proof.
So obviously, Cure have had independent studies done. They've had their products tested and reviewed by genuine dermatologists. They have many Trustpilot reviews and so on and so forth. There is lots and lots of proof to back up the claim that they're making through their mechanism.
So how do you build one? So this is a step-by-step of how to build it. So how's the problem typically solved, and what does the category assume about the solution? Okay, so, for example, with the hair loss thing, the hair loss is just a part of getting older. Your hair is going to get thinner, particularly for men.
So find where the traditional approach fails. Why doesn't it work for your customers? What's the gap between a standard solution and the result they want? This is where you can go through your reviews and look at those gaps between expectations and what people want to happen,

what they're seeing happen, if they've got the results they want or not. Then you want to introduce what's different about your product.
Okay, so what does your product do differently that addresses the failure of the traditional approach that is the mechanism? So introduce what's different about your product and then you want to name it.
There are a bunch of ways to do this, but a quick way is to use plus sensory words you can use acronyms or a founder's name. The name makes it ownable. What you call it is very dependent on your niche.
If you're working in quite a scientific niche, like in skincare where science shows a lot of credibility, you might want to go with something that sounds quite scientific. That doesn't mean it needs to be hard to explain. It just means it has to have a scientific-sounding mechanism and then connect it to the benefit.
Okay, so the mechanism isn't the benefit, but it's the reason. The benefit is believable, and you always want to tie your mechanism back to the outcome that they want to achieve. So this new way of doing things, this new mechanism is how you get to where you want to be in life, how you achieve that goal. More hair, less weight, better looking, less wrinkles, whatever it is, right? This thing that our product has, this mechanism is what unlocks that opportunity for you because it does things in a different way.
Okay, so a working example for... This isn't the one they use, but I just wanted to keep it simple. So the traditional approach, right? So the traditional approach to solving the problem that Krisp solves is to apply creams and creams topically. You rub them on the surface of the skin, and you hope that they get to where they need it, right?
You know that when you put stuff on topically, the skin is a barrier, and not everything is going to get through it. That's the skin doing its job. So why does that fail? Well, it fails because a lot of topical products sit on that epidermic layer, the outer layer. They can't penetrate into the skin where collagen loss and aging actually happen.
So customers use them faithfully. They've got serums and potions and motions and all this sort of stuff, but they're seeing minimal results. Maybe their skin feels a bit better, maybe they're having fewer breakouts or whatever, but they're not getting the desired thing.
So what does Krisp do differently? Well, the 24 gold-plated micro-needles create micro-channels in the skin surface. Serum can go through those channels deeper into the skin. So the delivery method is a differentiator, not the serum itself. The serum itself becomes a secondary massive benefit because they have very high-quality serums that actually tackle those causes. But the delivery mechanism is what separates it out from all those topicals in the marketplace. And then naming it. So MICEL micro-channel delivery. Okay, so that's ownable as a mechanism because it's specific, it's descriptive, and it's immediately understandable.
If I had to go and tell my friend, they'd go, "You're looking great, by the way." Yeah. I've just got this new product from Krisp. It's got microchannel delivery. So basically, it just punches little holes in your face, and everything that you put through it gets deeper into the skin where it can really work.
Okay? Then connect it to a belief so your creams aren't reaching the layer where aging happens. Microchannel delivery gets the ingredients under the surface where they can actually work. This is how you do it, right? The traditional approach where it fails, what you do differently. Name the mechanism connected to a benefit. Sounds like a lot of work.

It's not. All of these slides will be available so you can train your favorite AI on all this education that you're getting within these modules and have it understand exactly what you understand so it can do the legwork for you.
You can do the thinking behind it. It's the best way to work. So mechanisms importance increases with sophistication. As I said before, stage one to two, the market's new. You can just mention that it exists. We've got this cool thing. As soon as you get to stage three and beyond, where competition starts to get a bit more aggressive and a bit more crowded, your mechanism is the reason you stand out.
It's "We do things differently." This is why what we do is different and how it works. Stage four, you really want to sell the mechanism. Okay, so your cop, your mechanism might have been copied, which happens a lot, sadly, in this particular niche or counted.
So you want to amplify it with proof. So not only do we have this thing we can back up that this thing that we're saying works because we have dermatological approval, clinical trials, hundreds and thousands of reviews, etc.
Then stage five, when the market is exhausted, that's when you want to talk about the mechanism paired with identity. So the reason these topicals haven't worked before is because they are really tailored towards much younger skin. After 40, your skin changes. You need to do this to renew and refresh it
because your collagen in production is declining and this is the new opportunity for you to fix it because this is designed for people your age with your skin type, that kind of thing. Do you get me? So naming your mechanism.
Okay. A name mechanism is a lot more memorable than a descriptive one. Okay. If you think about some of your favorite brands, particularly like sporting goods brands, or car brands or those kinds of things, they typically have naming mechanisms that really stick.
So yeah, one way you can do this is using a verb plus a sensory word, like microchannel delivery, freeze drive, retention, deep fault recovery. When the mechanism involves actually doing something like carrying out a process, you can use the mechanism to create something the customer can visualize. It can be an acronym. A lot of things in sporting goods or fitness revolve around acronyms, right?
So grip, for example, we use grip tech graded resistance, impact padding. So it could be padding if you're doing MMA training or something where it could be the DT defense system. It sounds really systematic and powerful and clinical and no nonsense. It can be a found or origin name.
So if your brand is built around a specific founder-led brand or you're going for an angle like doing things like Grandma used to do, going back to the old ways, a lot of these beef tallow brands work well for that.
Okay, it's when credibility or heritage ads. So we're talking to a nostalgic audience like, "Yeah, let's go back to the old ways." We don't understand all these chemicals. It's too confusing. Everything's scary. Let's just put beef fat on our faces and hope for the best. I don't know. Beef tallow is an interesting and controversial one, but cool as well because there are some people that say they get phenomenal results. Some people say it doesn't work, so it makes it a really interesting market to tackle. Very cool.

So deliverables are a unique mechanism for your product pass if it does these things okay. The traditional approach where it fails what your product does differently, the mechanism name, and how it connects to the benefit.
So if you can do that, if it's specific, explains how it's distinct. It addresses pain, it's named, and it's backed by proof, and you go, "Boom, check it." Got that? Then you've mailed it, and that's what we're going for here.
Okay, so a promise without a mechanism is just a claim. So just because you've labeled it something without being able to explain how that doesn't make it a mechanism, that just makes it a label. When you apply the how to differentiate yourself, you then have a mechanism, and a mechanism is ownable. It differentiates you, it builds hope, and it gives people a new opportunity.
Okay, so that is module 11. Thanks for watching. The next module is module 12, the beliefs you have to break. This one's super important because everyone has beliefs, and as a marketer, one of the biggest and most powerful skills you can learn is to understand the belief and how to change it. See you in the next one.

Transcript 12

David Briggs | 00:00
Hey guys, welcome to the ECOM Architects copyrighting course. This one is very psychological. So this is where I get to geek out a little bit. But you're going to find a ton of value in this because this is something that is so often overlooked, even by really experienced copywriters, and it's absolutely fundamental to improving your hit rate and the success of your copy.
So let's dive into it. So the belief you have to break is about strategic positioning and about changing the way people think on a fundamental level. A lot of times people think this is impossible.
It's not when you do it right. So I'm going to teach you exactly how right now. So every sale requires a belief shift, okay? Right now, your customers believe something that's preventing them from buying. They have a preconceived idea of how things work. They have misinformation because we live in the misinformation age.
You don't change beliefs by telling people they're wrong. You aren't pushing them. You're pulling them towards a decision. You are guiding them to a new way of thinking. So the skill here is in diagnostics, right? We are diagnosing the exact belief that is preventing the sale, not a category of beliefs.
It's the specific thing that is blocking the sale. And that, again, comes from all your research that you did previously. Go check out my research module. So, for example, they think it won't work. Yeah, they think it won't work, but I can't learn anything from that. I can't tackle that as a belief. However, if I dig into my reviews and I discover that they believe no topical product can affect the deeper layers of skin where wrinkles form, or they believe their skin type is an exception that's specific enough to tackle, I can work with that.
This is how... Okay, so there are two sentences that drive everything. Okay, once you've identified the blocking belief, this is what you want to do. You want to write two sentences, and these become the compass for every piece of copyright.
So the first one is the blocking belief. Put it into words. So what does the customer currently believe is stopping them from actually buying? Okay, so it should be written as a specific statement that is falsifiable.
Okay, and that means you can prove it to be false. So example is like products that sit on the top of the skin can't fix what's happening underneath it. That's what they currently believe. Okay, the second sentence is the new belief.
So what does the customer need to believe by the time they get to the end of your copy? If that's where they start, what is their endpoint? So it could be something like the problem was never the ingredients, it was the delivery.
So it's not that these things don't work, it's that they would work if they would get into where they needed to go, and the micro channels are what make that possible. Okay? So where do they start? Where do you want them to end up and where you're trying to get them from point A to point B?
So how do you shift the belief? So there is a really interesting psychologist called Dr. Steven Novella who talks about something called the backfire effect. Now, there are... I am somewhat obsessed with logical fallacies.

If you are into psychology and understanding and you want to improve it, just google the most common psychological fallacies. We make false conclusions all the time as human beings. One of the most common ones is the fallacy of causation, which means if B happened after A, then A must have caused B.
That's not the case. There could be a million different reasons that B is caused, but we like to see things as linear events. Okay, Dr. Steven Novella talks about something called the backfire effect.
And the backfire effect is that if you directly challenge someone's belief, even if you have all the evidence in the world to prove that they're wrong, they are more likely to dig their heels in and stick to their original belief than they are to change.
Because no one likes to be just told outright to their face that they're wrong. That is not how you approach belief shifts. So this is how you can do it in a way that actually helps people shift their belief system in a way that's non-combative, not defensive, that kind of thing.
So you can leave with agreement. Okay, so start where they are, validate their experience. "You've tried everything before. It makes sense that you're skeptical." So you're validating their current emotional state.
Look, I get it. You've probably been burned before you've tried the really expensive serums. You won't get the results you want. I understand that, and then use questions instead of statements. Questions are not... Questions are open to interpretation. You are guiding someone when you question.
This is why lawyers get paid so much money because they do this very effectively. They guide people to certain beliefs and certain things through their questioning. So what if the problem wasn't the products you tried, but where you were actually getting to where you were reaching? So a question invites them to think about it in a reflective way rather than just outwardly telling them they're wrong. Ideally, you want to let them draw their own conclusions. So you want to present the evidence and walk them through the logic, but you want the reader to arrive at their new understanding on their own.
Because when people believe they've got there on their own, they don't feel like they've been hoodwinked or been pushed into something. They're like, "I've put the puzzle pieces together that have been presented before me, and I have reached that conclusion." That way, they are much more confident in their decision because they don't feel they've been forced into it. They feel it's being revealed to them, and they have figured it out.
So, for example, it could be an infographic or part of an ad where it shows how the dermis layer is a protective barrier, and a lot of products can't penetrate through that skin. It could then show how the microban system mechanically pierces through the outer layer to allow ingredients to get into those deeper layers of skin where they can be more effective.
Then you want to reframe and not attack them, right? It should never feel like an attack. We are not there to tell them they're wrong. You're doing everything wrong. We're there to say, "Hey, you probably haven't... Don't know about this. We totally get where you're at. Have you thought about it like this?"
Because this is what our product does and this is why it works. Then you don't want to say their old belief is wrong. You want to just reframe the context of it. Okay? It's not that those products didn't work.

It's that they were only limited in what they could do because they weren't designed to tackle what's happening below the surface. When you do that, when you structure an argument like that, you can completely change the way someone thinks now to the way that you want them to think.
But it is a delicate dance of how you guide them there, because when people feel attacked, they become very defensive. In any scenario, that's not how you want to deal with your customers.
So yeah, again, going back to my case studies, a beauty device brand. The block in belief was "This works for other people, not for me."
So my skin is different, I'm the exception. It's not that it doesn't work at all. It was self-exclusion. So it's not that they didn't believe in the product, they just didn't believe the product could work for them.
So why did that block the sale? Well, benefit-led copy actually reinforced that belief. The more benefits you listed, the more that customer that was self-excluding was like, "That sounds great. If that thing works for me, I'd be great, but it's not going to work for me."
So selling harder actually made it worse because it just gave that person the impression that "This thing sounds amazing. So I'm... But it's just... It's not for me. It's not approaching me, right? I'm not going to jail with this.
So the new belief they needed was it hadn't worked before because it wasn't... What you tried hadn't worked before because it wasn't built for your skin type. This one is. So the shift is from "I am the exception" to "The approach was wrong."
It's not actually me, it's that the approach was wrong. I needed something specific to my identity and my skin type. So we stopped selling the benefits, and we led with this idea of biological response and profiles, right?
So we started naming different types of skin identifying features. So people go, "Yeah, that's me." Then we use self-recognition hooks instead of persuasion. So the viewer, the person watching the ads, was like, "Yeah, I fit that category. This makes total sense. Now, this is for me."
Then they could opt themselves back in. He had a great click-through rate. Made a ton of money. Everyone was happy again. The kind of pain relief brand. Another true case study from my career.
So the blocking belief is maybe it's inflammation, maybe it's muscular, maybe it's just my age. Every new solution is just another theory. So people were overwhelmed by all the different explanations in the market of why they had this issue, this pain issue. It was this, it was that, it was this, it was that.
They didn't know where to look or what to believe. So they hadn't lost trust in the products. They just... I don't know if this is the right product for me because there are so many different explanations out there. I don't know if this is the right choice for me.
So the new belief was, "You haven't failed to find the right product, you've been solving the wrong type of problem. There's actually this other thing going on under the surface, and this is what you actually need to address. All of these things are great. They'll help alleviate the symptoms, provide some support and relief for you, but they're not going to tackle this root cause problem. This is what's going on. This is what you need.

So the advertorial walked from a first-person perspective. We walked them through the failures of all the common explanations, step by step. Lots of doctors or lots of people say it's this. It's often misdiagnosed.
Because if you have this and this as well, it's probably not this. Right. So, they stopped asking, "Does this work?" and then started thinking, "Yeah, that's me, that's my diagnosis. This is the right explanation for me."
So we've diagnosed two very different blocking beliefs in those two different examples I just shared, and we took two different copy strategies in order to solve them. So the first one was connecting with the identity of the person buying the product.
This one was ruling out, helping them rule out all the other options so they could see that this is actually the one that they needed and why. So how do you find blocking beliefs? You can start with your objection map.
In module 7, I gave you the idea of the real objection. So what are people? What do they actually mean versus what are they actually saying? Okay, that's normally the blocking beliefs that they are most deeply held, and they look at competitor comments sections, right? What are people saying about similar products?
I've tried three of these. None of these work. This whole category is broken. No knee braces are ever going to fix my knees. They just don't do the job. Listen to the self-narrative as well.
So module 8 we talked about the advert self-narrative. What is the story? They are selling themselves. If they're saying things like, "Maybe this is just what 40 looks like. It's all downhill after 40." That's a belief, so that can be changed.
It's not all downhill from here. Here's what's going on in your body. You know what? Over 40, you can be fit and healthy and strong. You can be the strongest you've been in your life if you start training now.
But your body needs a little bit extra support. It doesn't bounce back as quickly as it used to. It needs a little bit more help to get into peak condition. But you absolutely can do it. Here's how you're going to do that. Ask, "What would have to change for them to buy?"
Okay, so if that's their belief, what would they have to change in order for them to actually believe in making a purchase? What do they have to believe differently? How do you remove that blocking belief, and then try and write it as a specific sentence? You don't want to say, "They're skeptical about it."
Maybe again, using a cure example, their blocking belief is they don't think any at-home device can match what a dermatologist does. Well, you can answer that, "No, we don't try and match what a dermatologist does." Dermatologists' needles can go up to some crazy length into the skin and cause real damage. That repairs very beautifully over time.
That's not what we do. What we do is provide this superb interim product that before you go for a really extreme thing, maybe you're only tackling fine lines and shallow wrinkles or you just want to start a really good healthy routine that helps the skin regenerate natural collagen.
That's where we are. So their belief is that it's not going to be as good as the clinic. We're not competing with the clinic. We're offering an alternative to the clinic that's more accessible, that's easier, that has less downtime, and that you can do comfortably from home without having to stress about the clinic.
So we can tackle that belief because we can identify it, and we can change that person's way of thinking. So testing every line against the belief shift. So once you grab your two sentences, the

block in belief and the new belief, every line of copy can be evaluated against one question: "Does this sentence move the reader closer to the new belief?"
So when I talked about Stephen King and editing out everything that's not the story. When you are ruthlessly editing your copy, you can say, "Right, well, is this helping the castle move from point A to point B?"
Or is this just filler? Am I just writing stuff for the sake of it? Normally, if you do this and you're really ruthless about it, you'll find that you ended up cutting 30-40%, even up to 50% of your copy, because it's not adding anything and it's not helping you move towards the sale.
Maybe you're talking about features that nobody asks about, benefits that don't connect to that blocking belief. For example, if I'm talking to women over 50, the fact that micro infusion can help with acne, it's not really relevant to them. In fact, it's not relevant to them at all.
That's not why they're here. So me talking about that is just confusing my messaging. It's not moving them towards the belief that actually they can have younger-looking skin. It is achievable at home.
This is the system that helps them get there. Adding improve that doesn't address the specific doubt that they have. So, again, a 20-year-old is going, "Yeah, it's really helped with my acne scarring, so that's great. I'm really happy that you did that."
But I'm 50 years old with fine lines and wrinkles. I don't see how that proof is relevant to me in this scenario. Okay, so that's what we're aiming for. So how do you sequence the shift? I believe shift doesn't happen in one sentence.
It's a sequence. So we're moving someone from point A to point B, and it has a staged approach. Okay, so validate, right? First of all, we want to acknowledge their current experience, and then we want to introduce doubt, typically through questioning.
Right? So it could be that they're not wrong, but they're not getting the full picture right. We don't want to call them wrong because we don't want to get confrontational with them. But what if the problem is not what you're focusing on?
But it's this thing over here, it's not actually the ingredients. The ingredients are great in this product. This is a 200-pound syrup. Of course, the ingredients are great, but they're just not getting where they're needed. They're not getting into that really effective area.
Then you want to present them with some new information. Okay, so think about it this way. Then you can frame it as an analogy or a simile. The skin is like a shield. It's like a barrier.
It's like this. It's designed to keep things out. If our skins were super porous, then every kind of bacterial layer that landed on us would end up getting absorbed, and we could be sick all the time.
So in order to get the things we do want into our skin, we have to find a way through that shield, through that barrier. This is how that could happen. Then refran. So help them come to the right conclusion.
So afterwards, they're going that makes a lot of sense. So it's not this thing, it's this thing I get it now. Then offer them a new path. Okay, so the product enters as a natural conclusion. Well, our product actually is designed to do this exact thing. Now you understand what's going on, and you've accepted this new way of thinking. Here's how you can achieve that end result through this mechanism of my product.
So what are the common mistakes in belief shifting? Okay, obviously, I've covered most of these, so I'll go through these fairly quickly, attacking old beliefs directly. Why you're wrong. All

right, no one wants to be told they're wrong. Doesn't mean it matters if they are wrong or not. There is...
That is not how you approach a particular customer, someone you want to spend money with. You and I, ideally, are trying to shift too many beliefs at once. So, we need to focus on one main belief so they can focus on that the whole way through. We don't want to try and change three things at once because when we do that, we're asking way too much mental load from them. So this is wrong and this doesn't work and that doesn't... They're being pulled in multiple directions. You want one clear thing. So if they believe micro infusion, you can't get the results at home.
That is the focus, that's the belief we need to change, that's what they currently think. How do we shift them from that? We don't want to introduce loads of other concepts about the size of the molecules of the ingredients, for example, that muddies the water and makes the whole argument complicated. You don't really want to skip validation because people want to feel validated. They want to feel that their opinion or belief is justified, even if it's wrong.
Because we've all been in that position where it's like, "I might be wrong, but I can tell you where my idea came from, why I feel this way." So you should validate it. You don't want to introduce the product too early because if they haven't shifted their belief yet, then introducing the product too early is putting the horse before the cart, right? It doesn't make sense if they're judging the product based on their old belief.
So, for example, the micro infusion. If their belief is that it's not going to be as good as a clinic device, and I go, "Here it is," they go, "Well, I still don't think it's going to be as good as clinic devices." You haven't had time to shift their belief yet.
Then being too subtle, right? So a lot of ads, when I'm looking at them analyzing the metrics and stuff, you'll see that a lot of ads have a really good hook rate, a really good hold rate, and then no CTR or anything.
That's because the information's been delivered educationally, but it's not driving action. Vague hints and stuff make people go, "That's interesting," but they're not making them go, "Aha." You need to create the "Aha" moment where it's like, "Right. That makes total sense to me. I can see how this thing works. I want to go and learn more about it. I want to try this thing."
So shift them purposefully. Okay, so how do you do this? Right? So blocking beliefs one sentence of what they currently believe that's stopping the sale specific and falsifiable. The new belief one sentence of what they need to believe by the end of your copy.
So point A and point B. Then the belief shift sequence. This can formulate the skeleton of an abstract. So how do we validate their current experience? How do we question them to introduce doubt? How do we present the new information? How do we reframe their belief and then offer them the new pathway, point A to point B?
They're the steps that get you there. Okay? Then finally, take an existing piece of copy and mark every single sentence. Does it advance the belief shift? If not, you can cut it. Now obviously this is specific to a certain type of ad, but you will find that if you introduce the concept of belief shifting into your ads, you will get a higher hit rate.
Because everyone has a point A, and everyone can be led to a point B when you speak to them at the right awareness level, the right sophistication level, and you take them through those steps. So take away from module 12 is to find the belief, break it gently, not confrontationally, and replace it with a new provable truth.

So module 13 is up next, and we are talking about angle development from insight. It's a good one. See there?

Transcript 13

David Briggs | 00:00
Welcome to module 13 of the ECOM Architect's new copywriting course. We're talking about angles. What does an angle mean? What is it, what is in it? So on and so forth. So we can figure out how we can develop really strong angles and how we can make a ton of money.
So let's just get into it. So first of all, an angle is not a hook, okay? The hook is the first three seconds of a video that consists of the scroll stopper, the thumb stopper, the first opening line of the copy, and the visual text that pops up on the screen. One angle can have dozens of different hooks that work for it.
Okay, so the hook is not the angle. The hook is just how one way of framing that angle to get attention towards that angle. An angle is the entire strategic approach of a piece of copy, so it's the lens in which you are presenting your product to the world, whether it's through education, contrarian, these kinds of things.
So one angle can produce loads and loads of hooks, and that's how you're able to get lots and lots of creatives because you can have multiple angles with very different hooks, and you can see which ones work in, right?
So most brands get stuck in a loop of running the same three angles over and over again, and there are four key reasons why they do that. Let me just put my head to the side. Why does it do that?
Sorry, it's okay. So first of all, they pull from swipe files. Swipe files are a hugely valuable resource, but they don't replace proper research. They are there to support proper research. If you are pulling directly from swipe files, competitor ads that are already running, you are obviously running the risk of running the same type of ads as they are.
Then you just end up in the same sand pit as a big mess where everyone's competing for the same angle and the same attention. And people, if they see five brands running the same ads, they're going to default to whichever one feels safest. This one's got the most trust part of reviews. These guys have been around the longest. These guys are more aggressive or whatever. I'm going to go with them. They feel the safest. Number two is they start with the product and try and work backwards. The product is not the starting point for anything. The product is just the vehicle that helps the customer get to where they want to be. Feature-led angles really limit it.
What you're asking for your customer who's watching the video to do is a lot of figuring out. They're trying to connect the dots between, right? How is this relevant to me? How does that product fit into my life?
That's why these angles flop, right? If you lead with features, you're going to end up with the same recycled-looking at every single time because you're so limited in what you can say because it's all focused on product. Number three is this skip the research. All the modules up to this point have been talking about laying the right foundations. Build the foundation strong. Go deep into the research, understand all the different elements that you need to know about your customer.
Because everything becomes easier after that. Without deep customer insights, without knowing what they're saying versus what they really mean, you get left with very surface-level, shallow, obvious angles that lots and lots of competitors will be one. You don't need that.

The bonus thing that traps people in a loop is limited thinking. They think because they're in a certain niche, maybe this type of angle won't work. All angles can work for all niches if the approach is correct.
So how do you fix it? You start with your insights. Your angles are built on customer psychology, specifically to what you found from your research. And because they are built on that, they are built from a place of strong factual evidence. You are not guessing because you are looking at real consumer insights. What people are actually saying.
So you can be confident that your angles are worth exploring and worth building out. So how does the angle generation process work? It works like this. Okay, so first of all, you can pull from your discover work.
Modules 5, 6, 7, 8, and 9 of this course all give you options for different ways to find angles. Okay, there's review analysis, objection mapping, avatars, awareness, diagnostics. All of these things give you ideas that you can build into angles. There's mapping insights to angle types. Okay, so each insight can produce different types of angles. You can start to map what the insight is, and then what does that translate to in real life? So is it fear-based? Is it about being aspiring to be the best version of themselves? Is it to do with personal identity? Is it education, is it social proof, that kind of thing?
Then you want to cross-reference it against your competitors. Are they already dominating? Is there four or five brands absolutely dominate one specific angle? Then you need to evaluate if it's worth me then trying to get into that same mud pit with them and fight over that one angle. Or do I invest my time developing a new angle that they're not touching? Or I can speak very directly to my audience, and they will hear me. I won't be drowned out by my competitors. You want to evaluate for freshness and charge.
So those two criteria are really important. Freshness is to do with how many other people are doing it, and charge is to do with how deeply emotionally it resonates with your audience. Do they really care about this? It will be a superficial thing.
If it doesn't have a lot of charge, it's going to be really hard to make it stick because people don't care deeply enough about it. And if it's not fresh, then you're going to be competing with a lot of people who are saying the same thing.
Then, when you want to generate somewhere between five and ten, 5 to 15 different angles, you can explore and develop based on all of those criteria and your research. If you struggle to create angles, it's because your research isn't deep enough.
Because you should have angles for days. You should have so many angles. The headache you get is from figuring out which ones you want to test first. Obviously, you will prioritize those by the criteria we set before.
So, a working example for cure, right? Here are five different entry points. So, the regression angle going backwards. From the reviews, we learned that people said they'd noticed that the fine lines or the appearance of their skin got worse when they stopped using it.
So, this is a good angle to speak to people who are all about maintenance, keeping up appearances, and looking their best and talking about consistency and regularity of this product, right? That it works really well, but you need to keep doing it. Then there's the delivery problem. For a problem-aware audience, for example, that I like to try topicals and they're like, "I know I've got this problem of fine lines and wrinkles, but nothing I seem to do works." You can educate them and lead with a mechanism. Then there's the identity exception reframe.

If it hasn't worked, it wasn't built for your skin type. An easy way to lean into that would be to talk about how a lot of topicals are for very young, supple, absorbent skin. If your skin doesn't operate like that, it's not because you're the problem, it's because your delivery system is wrong. So, it's to speak into the identity of customers who have excluded themselves. There's the derm secret angle, which is hugely effective for cure. Very powerful angle because it is based on authority and credibility. This is the product dermatologists use. This is recommended by dermatologists. This is the real deal. They do demonstrations. They show you how it works. They explain how it works. Huge credibility.

It massively reduces objections in people because when they can see a medical professional using it, they are well, "This has to be a valid product." Then maybe the contrarian angle, right? You've got a drawer full of devices. Here's why they failed. Speaking to those burned-out buyers. Look, these things... Yeah, they vary in quality so much. We're not surprised you're frustrated with this, but here's why we're different. Over 100,000 people have bought our product. We have an average review rating of 4.7 stars. Dermatologists recommend it.

It's all because our mechanism is different from everything else you tried. So each angle comes from a specific piece of research. It's not from a swipe pop file. We've pulled these from all the different elements of research we've done to build out very powerful angles just from what we've already discovered.

Another example, like a pain relief brand talking about advertorials, we didn't want to keep hammering home the same thing that they'd already said because it wasn't working. People weren't burned out by the problem. They were

burned out by the overwhelming number of reasons that were being thrown at them for why they had the issue in the first place. So there are a number of ways we can approach this through different advertorials. It could be the wrong diagnosis.

It's not that you failed to find the right product. It's that you've been solving the wrong type of problem. These products are great, but all they're going to do is alleviate your symptoms. That's why you don't feel like they're really doing much. You feel like, "Yeah, it's great when it's on, as soon as I take it off and right back where I started, or even worse."

So it's a reframe through education. It could be a first-person story about explanation fatigue. I'm so sick of hearing about it. Maybe it's inflammation, maybe it's muscular, maybe it's age, all of these constant bombardments of all these different things. It could be

identity-led through that shared frustration. I was exactly where you were. Now, this is why... Then this is why I discovered... Here's what was really going on. It could be something like the cost of doing nothing, right?

So fear-based listicle. Here's what happens to your joints over the next five years if you keep ignoring it. It starts with something like, "If you noticed stiffness going up and downstairs, aches and pains in the morning when you get up, you really can't afford to ignore this. Here's what happens."

Then, a comparison trap. "Okay, stop comparing pain relief products. All the knee massages are basically the same thing. Start comparing pain relief approaches. What is going to help you rebuild the muscle fix what's going on under the surface and what is just a band-aid fix so it's repositioning their buying decision."

So these are all again, different angles that let us solve the real problem going on, but with different entry points that will speak to different pockets of customers. Okay, so angle types to

generate from... This isn't a complete list, obviously. There are hundreds of angle types you can come up with, but these are ones that I've found to be very effective.
So fear loss, right? So what are they afraid of losing or missing? Aspiration identity, who do they want to become? What's their kind of ID super ego version of themselves? Okay, what is the ego and super ego? What's their kind of neo from the Matrix version of themselves they'd love to be and how does the product help them get there? Education mechanism, explanation.
So what do they not understand about the product, or what education do they need to shift their belief that your product is the right thing for them? Then social proof or authority? Who do they trust enough to help convince them that the product is the right choice for them? Is it a personal trainer, a coach, an instructor, a dermatologist, a doctor, and a pediatrician, an orthodontist? Who do they need to listen to? Who's the authority figure that's going to drive action that they're going to go? I can trust this person. You can be contrarian, okay, so you can challenge a belief. You don't want to argue with them directly, but you can challenge their thinking. Why does everyone say that's actually wrong?
Okay, so for a long time, a lot of ads have done really well with the quarter's goal angle for weight loss. The stress hormone actually encourages your body to hold onto fat, and you're not really going to lose the weight. You want to lose the fat you want to burn until you deal with this. So everyone else will say, "You just need to exercise and move more." The reality was there was something going on underneath the comparison. How does your approach differ from the standard one? So what does your product offer? Case the micro needles. Instead of just dealing with things topically, we get under the skin to where we can really start making bigger gains and making better results. The story transformations of whose journey mirror the customers. Is there a really cool transformation story? These work really well in advertorials, and they work in long-form, meta-native ad style copy where you've got six weeks ago I was stuck on the sofa. I could barely move.
Yesterday I just finished my first 10K. Here's what changed. Then it's tying into that aspiration identity, but through a story and transformation, and then urgency and timing. Why did this matter?
Right now, not later. So that's really important because in direct response, we want to drive action now, not later. And sometimes, most of the time, people need multiple touch points. But we can very logically explain that generally, with the passing of time, something that's bad will get worse.
So why do they need to take action right now? If it's hair loss, it could be that. It's much easier to strengthen thicken hair that's there than try and replace hair that's fallen out, that kind of thing. So we can drive through urgency. So evaluate your angles. Okay? So not all angles or equals. You want to score them, and then that way, you can prioritize the angles that are most likely to be the most effective for you. There is no 100% certainty in marketing. Humans are not linear. They're very complex creatures with multiple thought processes going on at once. We can only control what we can control.
But when we apply these rules and these filters, we can give ourselves the best possible chance of success. So freshness right? Has the market seen the angle before? Emotional charge does it connect to a real deep emotional feeling? Provability can you back it up with evidence and then format? Fit does it work in the format you need?

So is it strong in video and static or at the tutorial, or does it only work as a ten-minute explainer? If it only works really well in one kind of format, that's fine. I find that a lot of first-person storytelling works actually better as text than it does in video.
Okay, it doesn't mean you shouldn't use it because you can't do it as a video. It just means you should think about marrying up the angles that work with the right mediums to deliver them. So some will suit video better. Some will be really good for mini cells.
Like a dermatologist-led explainer video would make a really good mini-VSL. It's educational, it's valuable. People feel like they've invested their time. Okay, so why does it matter? You want multiple angles because of the way Andromeda works. I'm not going to bang on too much about this because there's a lot of content within our courses related to this already.
So typically, if you've only got a few angles, two to three angles, you're not broad enough to really appeal to the number of audiences that your product is going to be appropriate for. Whereas when you've got a broad selection of angles, eight to 15 angles are able to match the angles to audience segments that resonated with it.
Fear drives people, people that have these interests, and people that have tried these things. It's able to diversify it much more accurately rather than just seeing everything as the same. Okay? When you have diversity in your ad account, if an angle starts to get a little bit tired and fatigue out, the other angles are already there. So you should have fundamentally different ads from doing your research properly.
When you marry that up with the sophistication levels, the awareness levels, the different entry points, and the different emotional triggers, you should never ever be short of ideas. So here's an AI workflow case.
So after you've done the research, and this prompt only works because you've done the research, and you know the insights, you can use this prompt. So here is my product description plus mechanism. Here is my lead. Desire. You take that from module 10. Here is my blocking belief. Take that from module 12. Here are my top customer emotional reviews. Take that from module 6. All the angles my competitors are currently running from the ad library, generate ten distinctive advertising angles for the product. For each angle, provide the angle type, a one-sentence angle statement, and an example hook on what customer insights build.
Okay? Avoid any angle overlap with what the competitors are already running. Prioritize the angle with the high emotional charge and low market saturation. These are going to be windows of opportunity. It does not mean you should completely disregard doing what your competitors are doing if you can find a way to prove your product is superior to what they're doing. There is opportunity there, but you will still be competing with a lot of noise, and it's harder to stand out, so this is a good way to approach it.
So what should you do? Your deliverables are five distinct angles for your products, so no two angles should be the same. If you've got two fear angles, then that's not two fear angles. That's one fear angle with two variations.
Okay, each should be linked to a specific insight. So what piece of research helped you create that angle? Where did it come from, and why is it a solid place to start? Each one should have an example hook, and the hook... So a fear-based angle can have a contrarian hook. Hooks do not have to be from the same family of ideas. You could have a question hook, a contrarian hook. You can have different hooks for one angle, right? It should be evaluated on those four criteria: freshness, emotional charge, provability, and format fit.

Then you can cross-reference with your competitors. Okay. So if none of your five angles overlap with the top competitors currently running, you've got a really good opportunity of hitting something that's going to be really effective and well received by your market.

Okay. So the takeaway from module 13 is that angles come from insights, not from swipe files. Swipe files are useful. You do want to have a swipe file. You want to see what other people are doing because it will give you ideas for how your ads can look. What's currently trending and what's currently working.

But the underlying theme behind them, what's actually going to connect with your audience on a deeper level and drive them to take action that comes from your insights, from your research, and from your work.

Okay, so module 14 is all about positioning against the category and not the product. We're going to move on to that next, and I'll see you guys there.

Transcript 14

David Briggs | 00:00
Welcome to module 14 of the new copywriting course for EC Architects. This time, we're talking about positioning against the category, not the product. Now, there are times when you do want to position against the product, but for most people, it makes more sense to position against the category. That way, you can shift the way people are thinking about their problem and offer a solution that is new and exciting for them.
So let's take a look at what exactly that means and break it down bit by bit and put my floating head that does this every single time in the top corner there. Okay, so let's get into it. So most copy attacks competitors now. When you attack a competitor, it's weak. The reason it's weak is because you are deliberately causing a direct comparison, and that's not really great.
Unlike other products, ours does X better ingredients than the leading brand. Why we're different from brand, why whatever that's product positioning, it accepts the existing category frame and tries to win within it.
So, if you're sending a supplement, for example, we've got purer ingredients, we've got this, we've got that. You're allowing your competitor to dictate the arena in which you are competing with them. It means that you're forced to play someone else's game, and if you are in a market where there are already competitors there, it's going to be very hard for you to get traction because they've defined the criteria by which your category, your product, is measured.
That's not ideal. So the stronger move and the smarter move, in my opinion, and what's worked for many of my clients, is to attack the category itself. So when you reframe the category, your product then becomes the only rational choice, not because it's better than the competition, but because it's actually... You're now offering an alternative solution that is outside of the category. So you stop playing a different game. So product position, our product is better than theirs, competes with existing frames, all that kind of stuff. I just said category position in the entire category is solving the wrong problem, so you're reframing the conversation. Customers stop comparing the alternative because you've dictated actually... None of these things over here. This whole category is not dealing with what you need. There's this other thing that you haven't considered yet. They don't look at that anymore because you have brought them over here. You are now competing in your own arena. You are giving them something different to think about. It works particularly well from stage three sophistication on. So when we're focusing on mechanisms with social proof and identity.
Okay, so how does it work? So you want to identify what's wrong with the entire category. So what are they getting wrong? So let's say, for example, we take Corel. So a lot of people in the category assume that the problem is ingredients.
So my topical skincare doesn't work because the ingredients aren't good enough. Whereas the real problem is the delivery system. So it doesn't matter. You could have the greatest serum on planet Earth, but if you're only using it topically, it's going to be limited in the effects that it can give.
So then you want to explain. Step two is to explain why the standard approach fails. Okay, so every cream, the serum, a device that you've used does the same thing. It sits on the surface. It's not penetrating that thicker, tougher outer layer of skin. The product is not the problem.

It's the fact that as long as this is here and you're putting stuff on the outside of it, you're not going to get the ingredients to where they're needed. And then the third step is to position your product outside of that frame. Our product doesn't sit on top of the surface. It creates micro channels that deliver ingredients under the skin in order to get them to where they are needed, where they are more biologically available, where they can start doing the real work. They're not going to be wasted sitting on top of the skin. This protective barrier.

So identify what's wrong, explain why the existing solutions aren't going to fix the problem, and then tell your audience how yours does. That's the three steps. Okay, so, if we're talking about a pain relief brand, one of my previous clients from a couple of years ago, what the category is saying is like, "Our delivery is faster, our formula is stronger, our products are more natural." That kind of thing. What they were doing wrong was assuming that the customer's self-diagnosis was correct. It was inflammation, it was muscular, it was wear and tear. Nobody was really questioning how they came to that conclusion in the first place.

So the ref frame was, "Hey, you haven't failed to find the right product. You've been solving the wrong type of problem." So it made it look like everyone else that had been trying to solve their problem previously was actually just treating symptoms.

So sure, all of these things that they're doing over here, they might help with the symptoms. You might feel a little bit more comfortable, but as soon as you stop, it's not going to work, right?

So we reworked the copy to go through the common explanations and show why each one was incomplete. So to give a really clear example of this, someone had shoulder pain, right? So they tried a bunch of shoulder braces and supports and exercises and stretching and all this kind of thing. The reality was that the shoulder joint was being affected by the hip joint, which was being affected by the knee joint, which was being affected by the ankle joint. It was a whole chain, posterior chain issue.

And when we could rule that out, the reason nothing you're doing up here is because you've got this misalignment. This is what's actually going on. We were able to massively increase their ROBS. Buyers stopped asking the question like, "Does this product work?"

They started asking, "Is this actually going to solve the root cause? Is this finally the right explanation? Is this why nothing I've done up until now has worked? Now I truly understand what's going on.

Okay, so Cure's category... We did this quickly earlier, but we'll just cover it quickly now. So the assumption is that better skincare comes from better ingredients, and obviously to some degree that is true.

If you put junk on your face, it's not going to get you results. If you put high-quality stuff on your face, it is... But it's going to be limited. So the arms race for a lot of this category became the quality of ingredients and purity levels.

Then they're all saying the same thing, they're making the same arguments. Big claims that the reframe was actually the ingredients only tell part of the story. The delivery system, how those ingredients get onto and into your body.

That's what matters, that's what separates them out. Okay, so the reframe in this case does three things simultaneously. It makes all the competitive ingredient claims feel superficial.

It's like, "Sure, you know that is a good product. No one saying it isn't, but it's still going to be limited in what we can do." So it weakens all their arguments. It explains why nothing the customer has tried up to this point is actually working.

Then it positions Cure's new delivery system as the solution that solves both those issues. It doesn't have to be overly aggressive. This is education. You're able to undermine and push your competition out of the way by eating them.
So this isn't about attacking the brands, it's about educating people on the category. Things evolve, our understanding moves on. We now know this new thing that it has to get through that skin barrier in order to truly be effective.
Okay, so a quote from Tod Hopkins. I really recommend reading Scientific Advertising if you haven't. Breakthrough Advertising. As Eugene Schwartz. Scientific Advertising is Claude Hopkins. It's worth reading.
So adds to salesmanship with accountability. So write like a salesperson. The mechanism behind the product matters more than the product itself, okay? This is why you will see competitors left, right, and center with what looked to be pretty mundane, run-of-the-mill basic products doing really well because it's the mechanism they are using behind that people are buying into.
Write like a salesperson. Ultimately, our goal is to sell. So put yourself in the shoes of your customer. If you were going to buy this product, what would you want to know about it? What would satisfy you? That it's different, better, and you are faster.
It's going to get you to where you want to be. It's going to help you become that idealized version of yourself. So category reframing is fundamental to standing out, particularly if you are in stage three or above sophistication.
Let's face it, stage one and two products are quite rare nowadays, and they're very risky because if you're first to market with something, you're largely unproven. So that's a consideration as well. This is about explaining why the whole category of previous solutions isn't solving the problem.
So when to use category positioning versus product positioning? Okay, so product positioning works when you have a clear measurable advantage. You could do a side-by-side comparison, and you could show that your product is three times faster or 50% cheaper or clinically proven where others aren't, right?
It's a basic... Yeah, you could try this, but actually we've done the same thing. It just has all these advantages and none of the drawbacks. Okay, if you're still in stage one or two markets of sophistication, product positioning can work.
So customers are still open to the idea of the product. They haven't been burned. They haven't gotten dissatisfied yet or whatever. You can still make bold claims and stand out. If there are only three competitors, you can just pick a claim that really makes sense to you.
Like, "Results in as little as four weeks." You can build around that. That's a product positioning. These guys take six to eight weeks if you want to see results in a month. This is the one for you. Category positioning is where most of you guys are going to be and where most of my clients are.
So they are people who are in three stages, three to five, and claims alone are not going to differentiate you enough. Everyone's making similar claims. The customers think they've heard it all. You need to change the conversation.
So you need to stop competing on those levels to start reframing and saying, "This is the new approach if customers are in a cycle of blaming themselves for failure, right? Nothing works for me. I've tried that.

I've done the exercise, I took the supplement. It didn't work for me." Then you can reframe it. It's not because of you. It's because the other things you've tried didn't have this special thing. It didn't have this delivery system. It didn't have like POSM kind of things to protect it. Getting into the gut. It didn't have a way of getting through the outer layer of skin, whatever it is.
The final one is if your mechanism is the real differentiator. So if your mechanism is genuinely different from the standard approach, then it makes it a no-brainer that this is why it works better, right? It just makes sense.
Well, we don't do things that way. We do things this way and these are the results we get. This is why it works because we're not falling for that trap. Okay, so here's how you can find your category reframe in a practical way.
So list what every competitor assumes. So what are all the products in the category take for granted? What shared logic do they follow? Then you want to write down the default position and then you want to find flaws in their assumptions.
For example, if it's like the ingredient position in every competitor saying, "Hey, you just need high-quality ingredients, you need better purity, you need this and this." Well, what's the flaw in the assumption? The flaw in the assumption is that topicals are the best method to get things into your skin.
Well, that's not the case. It's outdated science. Not understanding what the skin barrier is for and how to most effectively get ingredients into your body where they can be used in many cases.
If you haven't seen Module 11 yet, go back and check when you do your mechanism work. That will reveal this to you, the false assumption everyone else has, and how you can monopolize on that. Then you want to test it against customer experience, right?
So does the floor explain why customers have been disappointed previously in skincare? Absolutely. Right. So you might go through a bunch of reviews and go, "Yeah. They're actually all saying the same thing that it might feel nice on the skin. They're noticing that the skin is softer or more supple, but it's not dealing with those underlying issues that it promised to."
Then you want to write your reframe as one paragraph. So what do they assume? Why does that assumption fail, and how does your product overcome that failure? What does it offer that is different?
That paragraph becomes the backbone of your copy and your positioning. Okay, so supplements, right? A common one is absorption. So the body can't absorb, but it can't break down. So BI availability becomes the bottleneck. These are great products, but your body's not actually getting any.
So we look at different methods. We look at tinctures where you drip it under the tongue and it gets into the bloodstream and quick up. We look at gummies that have protective coatings or whatever. It's not actually the formulation oftentimes is the absorption.
So sleep products, right? It could be something like the assumption that comfort is all you need to get better sleep, but it could be that you're carrying tension or stress and actually be having a softer pillow is not going to resolve that. You need to go through some sort of ritual that helps break down or alleviate that stress and tension, and then you'll get better sleep. Pre-worn socks are a phenomenal brand to study. They've got great lists, advertorials, and all sorts going on. Check out Hollow Socks. It could be something like "Better materials are going to prevent blisters when actually it's not a quality, it's a design."

So you need to... They need to be engineered to be seamless to reduce the possibility of friction points where it's actually the underlying reason for blisters. Anthropic in skincare, right? I'm not going to do that one because we've done that one enough but covered it.
So kind of task for this module is category assumption one sentence. What does every competitor in your space take for granted? What are they assuming everyone thinks? Number two, why does that assumption fail?
So what actually could be causing someone's problem or what thing are they not addressing? They're sweeping under the rug, they're turning a blind eye to that is leaving people disappointed. Your product positioning outside the frame.
So one sentence. How does your product address the real problem that the category is overlooking or ignoring? Put those three into one paragraph and then based on your market sophistication level, which approach is going to be right for your brand right now?
So if you are at sophistication level three, there are a lot of competitors making big claims. You need to stand out, focus on that mechanism, that reframe, position yourself against the category. What we do and other people aren't doing it, so stop looking over there. It doesn't know what they're saying, what we do.
If it's stage four, then we're talking about adding that mechanism with the social proof and proof elements, right? Yeah. There are a lot of people saying that they've got a special way of solving this problem, but actually ours works. Here's all the proof that it works.
And here's... Let me explain to you how it works. And if it's stage five sophistication, then we're talking about identity. So how do we play into an identity of people that feel like they have been burned before?
So then it becomes there's a whole bunch of mechanisms and look at all this proof. But the truth is they weren't... These things weren't designed with you in mind. One category that works really well is products for dark-skinned people, black people.
It's because they are often underrepresented as a demographic. And lots of products that are specifically designed for white skin don't work the same way for black skin. So if you were to create something that was working really well for white people and then figure out a way to engineer it to work for black people, you can go to sophistication five. The market's there. Finally, someone's made a product for your skin type, your skin tone.
That's the kind of thinking here. So take away, don't compete within the frame, change the frame and then you'll win. Next up is module 15. This is where we get into the nitty gritty mechanical side of things.
So what makes a hook actually work? See there, guys.

Transcript 15

David Briggs | 00:00
Welcome to Mochel 15. We are halfway through this copywriting course, and we are talking about hooks today, so let's dive right into it. So obviously, it will be no surprise to you that hooks are incredibly important in creating effective ads, advertorials, even PDP pages. Those first few sentences, headlines, hooks, subheadings, all of these. The people, things, and the things people will look at first. SCM read here first are absolutely critical to the success of your copy's performance.
Okay, so a hook has to do two jobs, and lots of people get one of these, right? But they missed the second one. Okay, so the first job is the pattern interrupt. Does it make someone stop and watch the app?
If you scroll through Attria, for example, what are they doing in that first frame? Like, a lot of ads are using a gross, medical-looking hook at the moment if it's relevant to their product, right? That thumb-stopping image that's making me... What's that? I want to watch that. I want to play that. I want to see that.
So it makes them pause, it stops the scroll. It makes them slow down amidst all the stuff that they're consuming. The second job is to open a loop. So it is to give people a reason to continue watching the video.
So you want to create an information gap that the reader needs to close. For example, if I was consuming a lot of gym-based content, and then someone stops and they say, "This new way of shoulder pressing will double your gains and increase the size and strength of your muscles in just one session a week," for example, then they've created an information gap. I'm going... "That sounds good."
I want to know what's going on there, so I pattern interrupt without an open loop. So a pattern interrupt without an open loop that gives a payoff basically becomes clickbait. I'm sure you've seen loads of articles that are clickbait articles. There was one on my feed the other day, and it was like ten celebrities you didn't know were great singers.
One of them was Hugh Jackman. The first was like Hugh Jackman. It was like, "Well, Hugh Jackman literally came from a theater background. He was in Oklahoma. That's where he started his career." I'm pretty sure anyone that knows who he is knows that he's a good singer. So I felt clickbait because the payoff wasn't there. It didn't fulfill the satisfaction of an information gap. It actually felt like it was calling me to make the click. So don't be a clickbait person.
An open loop without a pattern interrupt. Chances are no one's ever going to watch it because you haven't got their attention in the first place. So two components working together is what makes a hook work.
Okay, so Mark Ford and John Ford from great leads. Another book everybody should read. They say the lead is usually 80% of the ad's value. So if you master the craft of the lead, you master the craft of selling in print. That means that top part.
I'm sure OSH will be talking about this a lot. That above the fold section, that first two to five seconds of your video. If you don't mail that, then nothing else below it matters because people aren't going to see it.

So if you focus on any skill that you need to improve continually, constantly refining, growing, getting better, it's hooks and leads. If you can do that, you're going to be ahead of 90% of people. So here are eight hook frameworks that really do convert well.
Okay, so, there are dozens and dozens, probably hundreds of different types of hooks. But they'll broadly fall into certain categories, and these are good categories to start with.
So a curiosity gap, right? Create a curiosity gap works really well with unaware or problem-aware audiences. Nobody tells you this about your skin after the 40s. Well, what does nobody tell me? It's got my intention.
It's got a good kind of pattern interrupt, and it's created an information gap. What is it that no one's told me? I need to flip the objection. So a great way to create hooks is to look at any customer objections that are in your category or for your product itself and deal with it head-on. So, for example, a category assumption might be that a lot of skincare devices are gimmicks like radiotherapy, a wand, or this or that. So hit it head-on, and you can deal with skepticism for a solution-aware audience. They might have heard about these various devices, but they're not bought into it yet.
So how do you deal with that? There's mechanism reveal. So, your creams aren't reaching where aging is happening, right? That is like for stage three sophistication you're leading with the mechanism to differentiate yourself in the market results statement. They work really well. 12,000 women last month switched to cure. Here's why. Again, I've got a striking disruptive statistic.
Then an information. Here's why. Well, why do I want to know why now? Your self-recognition works for problemware audiences, people who are frustrated, people that maybe have felt burned before. If you've tried everything to deal with your knee pain and nothing works, you need to read this. You need to watch this. We're going to tell you exactly why and what you can do about it. Contrary in claim. Stop comparing products, compare approaches. Stop thinking this is going to solve your problems when actually you need to do this. Instead, challenge people, make them think about what their assumptions are and how you can reframe that. Just like in the previous video story openings work super well for... Yappy videos are where it feels like a stream of consciousness.
It's like a UGC creator, and they're like. They're doing the makeup in the mirror and... "Last Tuesday, this happened to me." Then I was like, "My God. This happened." Super engaging because it feels so authentic and organic. You're sucked into the story and then a direct challenge.
If you've got people that have a lot of assumptions, you can directly challenge them head-on. This works quite well, particularly for male products, because people watch the video just to say, "Actually, it was right all along."
So you can play into people's egos as well. So the framework tells you the structure, and your insight tells you the content. So that's what we're building. If you think about all the previous modules we've done, we're starting to pull all those threads and all the foundation work, and weave it into something that is going to just take your copy to an absolute world-class level. That's what we're doing here. So same product, different awareness, different hook. Okay, so we're going to use CorelDRAW as an example. I don't think these are hooks they've used. They're just ones that I came up with that benefit this course.

So unaware. Last week, my friend asked what I'd had done. I hadn't had anything done, so that sounds interesting. It's a story, it creates identification. That sounds like something I would quite like. I would like my friends to go, "Hey, you look great." If you had some work done, and I'd be like, "No, I've actually been doing this thing."
It's relatable, right? So that's for another-aware audience. A problem-aware audience needs something different. You can identify the issues that they have already identified in themselves. If your skin looks tired, no matter what you do, the problem is effort. I'm going to tell you what it is.
So they feel it. They know they're dissatisfied, but they're not actively searching for any solutions yet. They're aware that something's not right, but they're not doing anything about it. So you want to validate that they have a problem, right? You want to say, "Yeah, you know what? It's not in your head, it is real, but there is something you can do about it, a solution." Aware this is where your mechanism really comes into play in the cure example here.
So solution-aware audiences, they've probably already been browsing, they're aware solutions exist, they've looked at different categories. So now we challenge the category belief. Your serum sits on top. It never really touches where aging happens.
Then you could go into your kind of... Think about it. When you put stuff on the outside, what's your skin the form? Your skin is to keep pathogens horrible things out. It's your biggest organ. It's your biggest layer of defense against the environment around you. So why would it make sense that if you put stuff on it just got sucked straight in? That's completely counterintuitive. So it could be a really effective way to explain that, right?
So product to aware is when they know about your products specifically. Or they might be looking at maybe one to two to three products within your category, and they're trying to determine which one's right for them.
So you want to lead with social proof, evidence proof, strength, and that kind of... This is the right one for you because we're different and we're better, and here's why. So they know you exist, so give them proof, and they're most aware. Most aware people have made the decision. They just need the urgency. They're sitting on the edge of the cliff. They just need to push off. So they're really looking for anything that guarantees their confidence in their sale. So risk reversal components, offers urgency, and tactics work really well here, and that's why retargeting ads, often in static image form, work really well for most aware audiences because they've already made the decision. They're just looking for that final reason to go on and buy now.
Okay, so vague hooks get scrolled past because vague hooks don't feel important. A vague cook isn't relevant to me, right? When you're speaking to a customer in a video, that's what you're doing. You're speaking to one person, one category of people. You're not speaking to all men, 37 years old with a little bit of fat. You're speaking to David, 37 years old, works a lot, has two kids. It needs to be relevant to my experience for me to care.
So specificity creates credibility. All of that research you did, all of those direct customer quotes, they are feeding that for you. You don't have to guess. They are providing everything you need in order to be successful.
Something like "This skincare device changed my life" is a bit weak. Ironically, that was actually your winner about three years ago, but in general, it shouldn't have been a winner. It was weak.

But something like "I woke up, looked in the mirror for the first time in three years. I didn't look exhausted." That's a moment in time that anyone who has felt that way, that has looked at themselves...
God knows I've done it. I've looked in the mirror on... It looks like your face is melting. Your eyebags are down to your cheekbones, you look terrible. Then there are days. I go...
"You know what, I don't look half bad today. That's great. I would have luck to have a lot more of those days than those days." So our customer loved the results vague, unspecific, what did she love about the results? Why should I care? Where's the proof? That doesn't tell me anything.
She sent us a photo. 14 days in, her husband thought she'd had fillers. Here's the transformation, specific kind of moment from the husband that she's bragging about. Super relevant, super engaging, much more credible and believable.
I've spent $2,400 on skincare in the last two years. This is the first thing that actually did something much more convincing. Because you've attached a monetary amount, spending money hurts. People don't want to spend money. You're trading hours of your life in most cases for that money.
Then the idea that you're then spending it and it just... On products that aren't delivering their results, that's painful. So it's relatable. We've all at some point in our lives felt that pain.
So you can bring people back to that moment and say, "This thing really works. Let's move part, and I'm going to tell you why it's better than anything else I've tried." Vague, what did you try? Why should I care? What? You've tried...
If you tried... What? I've tried three devices in a drawer, $900 wasted. Then I tried this, and my husband noticed in two weeks. I love using the husband line in marketing copy, because women everywhere have a little chuckle to themselves.
Because men are not known for being the most observant people. We tend to... Men and women both have their pros and cons in the way that they see the world. Men in general tend to be very linear with their focus.
So unless something has been brought to their attention, they're not really looking for it. That's why you can go into a room and you would find the one thing that you went in there for, but you'll have missed absolutely everything else.
So it's a relatable moment that a lot of women will be... My husband's exactly the same, right? The fact that he knows that must be a big deal. So it's playing into the humor of the gender and gender balance.
How do you diagnose a failed hook? So if it's got low impressions or a low click-through rate, or a low click-through rate... Sorry, the hook isn't creating a pattern interrupt, right? It's not doing enough.
If it's got a high click but a low conversion rate, it's stopping the scroll. But then the open loop is not leading on from that. It's not delivering on the promise that the hook sets up. So the hook is like the curtains open and ready, and then the open loop is it's not there.
So you want to align the hook promise with the product's actual value. The hook should be setting people up for the big reveal, the open loop, and then the close of the loop where people go, "My God, this is awesome." High hook rate with low hold rate. The bridge, the lead from the hook to the body copy is weak. I diagnose a ton of this because people get really good at writing hooks.

But then the bit that connects the hook to the actual body... When you want to do the education or make your point or tell your story, that component there, the lead can often be weak. It should have hook energy and open that loop so people are set up for that story in the body copy.
If it works once and dies fast, there's not a lot of value in it. Do not be swayed by vanity metrics because we are here to make sales. We're running businesses. I don't care. Some of the ugliest ads I've ever seen have been the most effective ones because they deliver on their promise. There are lots of ads that rely on viral moments, and they're really funny, and people share them, but they're not buying from them. You'll find that if you work with influencers, a lot of influencers will talk about vanity metrics.
Yeah, but like loads of people... Who's Bork? Who are you actually making sales for me? So it's fine to use gimmicky hooks on occasions to get attention and do those kinds of things, but it needs to be tied into real value.
So, again, going back to one of my previous brands, a beauty device, we had to reframe it. So what did we do? Instead, we went for a self-recognition framework. It was about the person seeing themselves, the reflection in themselves in the ad.
I've been there, I've tried that. This is the first ad I feel is speaking to me as an individual and not just me as a category of people. I'm not... I don't see myself as being in that category. I'm over here where things don't work.
So what did we do? We had a pattern interrupt that didn't look or sound like a product at it was like a conversation. It was understanding and empathetic towards that person's way of thinking. It opened a loop.
So why hasn't anything worked for you? And then it promised an answer. Because we use self-recognition, that viewer felt seen. Their emotional response is stronger than any benefit claim that I could make.
Because they'd seen it worked for other people. They weren't saying the product didn't work, they were saying the product doesn't work for me. And that's very different. Then it prequalified. So only the right audience who saw themselves in that mirror were the ones that stayed watching.
That's why the CTR was so high. Okay? Not just the click-through rate, but the CVR because it was like, "I'm speaking to you." Then the advertorial that followed up from this ad continued that identification.
It was like, "My God, for the first time ever, I am being seen. Not just me as a group of people, I'm being seen." It was built on the insights from the objection mapping module 7. So feel free to go back. Customers had excluded themselves, so the hook was there to address that directly.
Okay, so hooks you can defend. So before you publish any hooks, you should be able to answer these four questions. Okay, what framework am I using? So there are others, but those eight primary ones are a great place to start because they do work. They've always worked. They'll probably work until time immemorial. What awareness level am I writing to?
So a really good hook that speaking to the wrong awareness level is going to flop. If people are already solution-aware, you don't need to beat them over the head with their problems. They get it right. They're already actively seeking a solution. What insight is it built on?
So what piece of research produced the hook? Was it a direct customer insight? Was it something someone said in a review? Was it a customer service conversation? Was it a complaint on a competitor product? What were you...? What was the foundation?

Okay. Then what open loop does this create? So when you hook them, what's the payoff? How are you going to open that loop and then close that loop and give them a satisfactory answer that progresses them through the sale towards making a purchase? You should try and assess all your hooks by these criteria because these criteria are... We're going to... Whether it's a hook worth trying or whether you're just rolling the dice and hoping for the best.

So generate hooks. After you've chosen your angle and framework and the AI fills this template, you are again, as we've said right from the start of this, you're doing the thinking, you're providing a strategy, and the AI is doing the grunt work.

So the prompt could be, "I'm writing hooks for my product, targeting awareness level of my audience. My angle is your statement from module 13. The blocking belief is from module 12 and the mechanism is from module 11. Do you see how all these threads are coming together?"

So generate 15 hooks using these frameworks: curiosity, gap, objection, flip mechanism, reveal self-recognition, and contrarian claim. Three hooks per framework. Each hook must be under 15 words. Create a specific open loop and connect to the blocking belief writing conversational sixth-grade language. No clichés like "No TED of X then try Y, it's been done to death." You can then assess which ones you might want to edit them. You might go, "Holy shit, I've never seen AI produce anything of this quality before."

It's because you've done the work, and then you can look for things like, "Well, which one do I feel is the most emotionally charged? Which one opens the most interesting loop that I would want to close if I were that customer?" And start to organize these hooks, right?

So this is what you can do. You can use that AI prompt for your product to figure out one hook fully written, the framework that you've named, the awareness that you've identified, where you got the insight from, what open loop you've started to create, and then five variations.

So it's the same angle, but you're going to use different frameworks, and what that will do is prove to you that when AI is used correctly with the foundational work that's needed, just how effective it can be, speeding up your workflow and giving you really high-quality copy.

So I don't know who it was. I think it might have been Claude or it might have been Howl Butt. It was one of the greats. They said the job of every sentence of copy is to get people to read the next sentence. In a similar way, a great hook earns that next sentence. Your hook opens the door so you can finally let customers see what you're about, what you can do, and how you can help them.

Next up is open loops, curiosity, gaps, and the first three seconds. Let's get it, guys.

Transcript 16

David Briggs | 00:00
16. We just finished hooking, so let's look at opening loops, curiosity gaps, and the first three seconds, which is just almost as important as the hooks. Okay, guys, so the reason open loops work is because your brain does not like unanswered questions.
It's the reason we love detective stories. It's the reason we love the pursuit of an answer. So an open loop is an unanswered question. It's unresolved tension in the reader's mind, and it creates what can only be described as a psychological itch that needs to be scratched.
So they keep reading or they keep watching because that loop hasn't closed yet. They haven't had the payoff. The trigger's gone, but the payoff hasn't. This is called information gap theory.
So George Lowenstein described it as "Curiosity arises when there's a gap between what we know and what we want to know." Those two points, we're in quite a lot of discomfort, so we keep consuming until it closes.
That's why when you're having an argument with your miss and she says, "I'm fine." You know she's not fine. I can't leave this alone because I know that there is something between what you're saying and what I know here that is causing an issue, and I cannot leave that alone.
So an open loop would be something like, "Your serums aren't reaching where aging happens." Here's what it leaves the reader thinking, "Well, what is it? I need to know what that is."
Whereas if you said, "Cures, micro needles deliver serum into the dermis for better skin." They're like, "Okay, I've got that information, I banked it." Great.
Then they move on, they stop scrolling, or they scroll away. Okay, so see the difference? Open loop, closed loop. So there we go. This is my quote from last module, but I couldn't remember. I said it was either Halbert or cables, but it's not sugar. Every element of the advertisement must cause the reader to read the next sentence, so that works with advertorials.
That's every piece of your copy, and it includes videos. Just substitute the word "read" for "listen" to... Okay? So he calls it the slippery slide. So once the readers start, every sentence pulls them towards the next.
Open loops are the mechanisms that make the slide slippery. So it's the thing that is... Because I've got an unanswered question, I need to keep reading to close that. Then I open another loop, and I open another loop, and I open another loop.
If you study some of the grades, they've written really long form, old school copy. We're talking 10-20 pages or 8,000-word sales letters. These crazy things that people used to do. That's what they would do.
That's how they would be hyper-relevant, targeted, and there would be loop after loop which they open and close and then weave in another one, pulling the reader through that piece of writing. So what's the clickbait trap? An open loop only works if the answers connect to your product.
If it doesn't or you leave the loop open without paying it off, you create a clickbait trap, and clickbait trap can get you easy wins on the front end. So a really clickbait article or a really clickbait ad will probably have a really high hook rate, but then it will have a very poor hold rate, and you're going to leave people angry and dissatisfied and frustrated and kill trust.

So you'll see a lot of... Sadly, there's a lot of brands in the ECOM space right now that put as on that they really shouldn't be running, and they have a lot of very clickbait-style stuff, and they have very low Trustpilot scores because of it.
They are now trapped in this loop of constantly having to find new customers because their attention is so poor, because they have deceived the customers they've already had. If you want a business that's going to last, build credibility, grow, be recommended, and be something you can ideally exit in the future,
that's what you're looking to do. You need to treat this with respect. Don't click bait people. So, a click bait might be, "I can't believe what happens when she puts this on her face." But if there's not a payoff, right? That could be a great hook.
But if there's not a payoff, then people are going to be frustrated. The loop is strong, but the art has nothing to do with why the product works. So people feel tricked. Strategic curiosity might be your serum isn't reaching where the layers are where agent happens. Here's what does...
So it opens a loop around the mechanism and that connects and that makes more sense. So it might not have the excitement of this one unless this one actually works, but it has a payoff that is meaningful for that customer and that's where you get results.
It's often in the mundane, simple connecting the dots. For people, that's where results actually live. We all like to think it's in extravagance. It's generally not. People have problems they're trying to deal with. They want solutions they understand are going to work. People are inherently quite simple.
So does closing the loop naturally lead to understanding why this product is the answer? That's a key component in figuring out whether you're being a bit too click bait or not. Now I will say that for every rule, there is a reversal click bait as well. If one experiment you can run is what's the most outrageous thing I can say about my product that I can pay off,
and if you can do that and I don't suggest doing it all the time, but if it's sprinkled in a few little places, you run a couple of banks like this, that can pay off really well. But it's not a default, and it's not something you should rely on.
So what are the five types of open loops? So the most obvious one is the unanswered question. So why doesn't serum work off the 40? Why does it work? I want to know the answer to that. You're directly asking a question that the reader wants the AI to... It doesn't have to be any more clever than that, as long as it's super relevant to your audience. The incomplete reveal, this one where it works really well and like TikTok hours and Google Sheets when you've got someone talking... There's one thing dermatologists know that skincare brands don't tell you, and I'm going to reveal it right now.
So it promises information, but it withholds the key detail. So people are like, "Okay, right? This guy's got my attention." This guy's got my attention or whatever. I'm invested. Now I want to know what's going on. There's the unexpected claim.
So most skincare products make your skin worse over time. So this is where you state something that is contradictory to what they already might think or believe, and it challenges their beliefs in a way that's exciting and intriguing.
Like, "Wow. Maybe I'm wrong. I need to know if this is true and why it's true." There's the story interrupt, right? So three weeks in, I nearly threw it away. Then I noticed something.

You start in the middle of a story and create a moment of tension where it's like, "Wow. I've just been dropped in here, parachuting into the middle of this conversation." She was trying this thing for three weeks,
and she was about to fly away. But then something changed, and I was going on that creates curiosity. Then there's the mechanism tease, right? So there's a layer of skin your products have never reached, and it's like "intro." It introduces a concept that requires... "That sounds interesting. I'm invested in learning more about this, but I need the explanation. I'm going to stay because I want to know more about this."
Okay, so there are five types of really good loops. So if we're talking about ad copy or longer form copy, you're using multiple loops. If you've got a 45-second video ad, you might have one, maybe two loops, maximum. You've got a lot to cover in a short space of time when you're writing on form copy outputorials or whatever. Often, your subheadings in each section, each block of copy, as we call them, will open a new loop.
That's when I discovered something my doctor had never told me before. This new way of approaching the skin was different to anything else I tried. It's opening a loop. So, for example, in this one, a loop opens. Your skin routine is missing one step.
Okay, that's okay, what step is it missing? It's the reason your serums don't work. Okay, so what is that reason? The missing step is delivery. So now I've paid off my first open loop by explaining the missing one step is the delivery, but not the way you think. Now I've opened another loop, right?
So I'm constantly having this person think and assume and try to fill in the gaps, and they want to listen because they want those questions answered. Serum fails because they sit on the epidermis. Microchannels change where the serum goes. Want to see how super short at? Very concise, and obviously, I haven't pulled out some of the filler copy in between, but open loop, close a loop, open loop, pay off a loop. We're constantly getting that person to engage and reengage with the ad to close those loops to get the information that we've dangled the carrot out there, and then we're letting them take the buy, right?
That's what we're trying to do when we're talking about managing open loops and the best copyrights. If you go and study the greats, if you go and study Halbert, Gary Benson, anger like John Benson, who else is right up there? Joe Sugarman's phenomenal. Dan Kennedy, even Alex Kmosi, phenomenal. Copyright actually. You will see that they do this continually, opening loops, closing loops, opening loops, closing loops, and they do it in very simple terms that keeps you engaged consistently throughout.
So we all know that different platforms have different scroll behaviors. These are very broad observations, so take them with a pinch of salt. But this is what we're looking at. So with a meta feed static...
So static image ad, the image is doing the interruption. Okay, so if it was a top of funnel static image ad, you might have a native-looking image. So it's something that looks like it's been snipped out of a magazine, a close-up of something that doesn't look... At all because you're starting the customer on a journey for a story.
That's how we're getting them in. If it was a bottom of funnel ad where we have a highly aware audience, it might be focused on really clean pictures of the product, great sale kind of thing. 40% off today. That right, but the image does interrupt the text overlays, the hook, and then the body copy is the loop.

So that's the format. The image stops you. The text on the image is what hooks you, and then the body copy is what sells. You want with a meta feed video, you've got the visual pattern interrupting in frame one, so that's your thumb stop. You've got your text on your screen.
So I like to call this the triple-three hook, which is where you've got the audio, the text on screen, plus the thumbs-stop image. Those three components work together. Okay. So often people have their feeds on it. Must catch their attention so they want to... On YouTube, Reels, and TikTok are full-screen verticals, so a face or action frame one works well because when someone looks like they're going to tell us something, we automatically want to listen to that. We're communicative beings.
Okay? Story so tappable formats you got one screen to stop tap through, one line, one image and make it easy to consume that kind of thing. Then obviously email subjects lines. The hook is the subject line.
If no one opens it, none reach your email. No one cares about what your offer is. So the subject line and preview line working together need to create a reason to open it. Curiosity. That's your loop.
Okay, so what are the big mistakes people make? So closing the loop too early. So if you answer the question, if you say there's one thing you don't know about skincare, this is the thing, then there's no reason to continue watching.
It's like my curiosity has been satiated. I'm fulfilled. I've got my answer. I'm going to see you later. So you want to delay the answer and build towards it. State number two is opening a loop you never close. This is the biggest way to kill trust and get massive frustration.
So lots of click bait to do this. They're like, "Make a promise at the start and then they never pay it off." You watch the whole video and then you just feel like your time has been stolen from you because we all understand that there's a tradeoff that takes place, right? It's like, "I give you my time, you give me my answer." That's what we've agreed to. You haven't done that. So opening a loop your product can't close.
So this is lots of brands where it now does this where it's like, "Lose seven pounds in seven days" or something you've served, right? Well, no product can do that. I mean, if you lost seven pounds in seven days, I'd be very medically concerned for your health.
So you don't want to over promise or create clickbait hooks that have nothing to do with what you're actually offering in terms of a solution. You don't want to have too many loops open at once.
So the idea is that if you open a new loop, it's because you've closed the previous loop, right? The maximum number of loops you want to have running at one time is 2. If it's a long piece of copy, you might have one big loop that you have to read through the whole article to close. Then you've got lots of mini loops that you open and close throughout it.
Okay, and using the same loop structure... If every ad starts, nobody told you this. Then people get wise to that pretty quickly. So look at what people are doing in your industry, what are competitors doing? What are people in adjacent categories to you doing? Do it if it's underserved, experiment with it.
If it's overused and kind of saturated, try and avoid it, because otherwise you just drown out. You're drowned out by the white noise of everyone else. So, the first second would be like a visual interrupt pattern interrupts your serials aren't reaching where aging happens, right?

That's op one, right? Where is aging happening and what's really going on? Everything you've applied sits on this layer. Points like this layer. Right? Aging actually happens here, deep up, right? Deep up.
So I've closed loop 1 and I've opened loop 2, so how do I reach it, right? If it's happening deeper, how do I get there? That's why 3 years of skincare didn't change anything. The delivery was wrong, not the ingredients.
Right? So I set up the close for loop 1 and now I closed loop 1 and my reframe from the previous modules lands because I've satisfied that person's curiosity. Then op 2 closes. Next these 24 gold micro needled create channels. The serum goes under, not on top. Through the skin, not on top. I super short.
Right? So two loops opened and closed within 15 seconds right here, and each one is making me go, "Okay, so I want the answer to that. You've given me the answer to that. That builds my trust. That builds your credibility.
Because you're making promises, but you're paying them off. So when you're doing an in-VSL, for example, if you're running an ad that's three minutes or more, you might want to have a couple of quick wins at the start.
So open some loops and close them quickly. It's the same reason game theory fascinates me. So if you're not clued up on game theory, go and read game theory. Game theory is like when you play a video game, right? When you play a video game, when you progress through your levels at the start, your character is useless. They can't do very much.
But very quickly, within 15 minutes to an hour of playing, you can suddenly do a whole bunch of other stuff. There's massive progression in the first 15 minutes to an hour of most video games in terms of what you can do, the skills, the options, the availability, all of this after you complete the tutorial phase.
That's because when you have received the gratification, you've got some quick wins. If the next win takes a little longer, your patience is there because the game has already proven to you that it will pay off on its promise.
It's just now you need to be a bit more patient. VSIs work the same way if you open loops early on and then close them early on, then you can spend the next minute before you close the next loop because you have built trust with that person who's watching and just be aware of that as well.
So how do we test the quality of a loop? Does the loop create genuine curiosity? So if the answer is super obvious and it means that the loop's going to be weak, don't try and pitch something like, "My God, have you ever heard of this cream you can put on that actually protects you from the sun?"
Yeah, sun cream, it's been around for 30, 40, or 50 years now, right? You're not... You're just going to leave people disappointed, thinking you're an idiot. Don't think that. Does closing the loop lead to the product?
Okay, so if the answer to closing the loop has nothing to do with the product, then you've got a disconnect there. You're clicking people, they're like, "Why am I watching this? Why should I care?" Is a loop appropriate for the awareness level?
So a mechanism loop will confuse an unaware audience. They don't even know what they should be concerned about yet and why it matters to them. So you're telling them about how

your product is completely different to anything else they've seen. They haven't seen anything. There's going to be a disconnect.
So a simple question will bore a product-aware audience as well, right? There has to be a match between the loop and the levels. Where is the person at? What kind of loops are they going to care about? How do I make my loops relevant to that person? Does the loop close before the CTA?
So if they get to the end of your video and there's an unanswered question, they're going to be pissed. They're not going to like that. They're going to feel unsatisfied. They're going to feel like they haven't got the value they wanted.
It leaves them in limbo. It's going to kill the effectiveness of the route. Then could a competitor use this exact same loop? Okay, so in many cases, there's going to be overlap, right?
But if your loop is built on your insights and not just something you've pulled out of the air, it will be much less likely that a competitor is using the exact same one. So it should be your specific mechanism. Your customer psychology from your research and your insights. That gives you an advantage.
If you just give AI a prompt and say, "This is where I'm at with no insights, no mechanism, no customer psychology." You're going to get the same one everyone else that has done that has got. Whereas if you feed it all this information, you get something unique.
Okay, so a hook with a genuine loop. So one hook with an open loop. The hook creates a question. The loop identifies, right? The answer connects to your product. That's what we're aiming for here.
So the loop type named... Which of the five types of loop are you using? Where in your copy does the loop close? What sentence is the one that delivers the answer? You want all five questions answered. Genuine curiosity leads to the product at the right awareness level and closes before the CTA. That's your checklist. Does it create genuine curiosity? Does it lead to the product? Is it at the right awareness level or does it close before the CTA? Is it competitive proof so not generic? Basically the same hook adapted for two platforms so videoscript and static. This will show you how a loop can work in different formats.
So can I put it as text? Can I put it as videos like scripting? Can I diversify the mediums in which I'm presenting this hook? So the hook and open loop working together is going to create a very powerful opening.
So of three to five seconds of your ad. That's what we're aiming to do. So take away from today is open the loop, delay the close and make them need the next sentence. Because if your copy isn't progressing people towards a sale, then it's not doing what it needs to be doing. It needs to be educating, progressing, moving people through that slippery slide method that Joe Strickman talks about. Moving people towards the sale. Every sentence should make them want to listen to the next one and the next one. Every word, every sentence they read should bring them further down.
So they keep wanting to consume that content. They get better education. Their objections are handled, they understand your product better, and when it comes to a buying decision, they're more prepared to take it.
Next up is "Show don't tell" in direct response. This is really interesting to me because I think it's one of the easiest ways to massively improve the quality of your copy is by identifying all your

show sentences or your tell sentences and changing them to show sentences, because showing proof will always be more valuable than telling someone something worked. So we're going to get into that next.

David Briggs | 00:00
16. We just finished hooking, so let's look at opening loops, curiosity gaps, and the first three seconds, which is just almost as important as the hooks. Okay, guys, so the reason open loops work is because your brain does not like unanswered questions.
It's the reason we love detective stories. It's the reason we love the pursuit of an answer. So an open loop is an unanswered question. It's unresolved tension in the reader's mind, and it creates what can only be described as a psychological itch that needs to be scratched.
So they keep reading or they keep watching because that loop hasn't closed yet. They haven't had the payoff. The trigger's gone, but the payoff hasn't. This is called information gap theory.
So George Lowenstein described it as "Curiosity arises when there's a gap between what we know and what we want to know." Those two points, we're in quite a lot of discomfort, so we keep consuming until it closes.
That's why when you're having an argument with your miss and she says, "I'm fine." You know she's not fine. I can't leave this alone because I know that there is something between what you're saying and what I know here that is causing an issue, and I cannot leave that alone.
So an open loop would be something like, "Your serums aren't reaching where aging happens." Here's what it leaves the reader thinking, "Well, what is it? I need to know what that is."
Whereas if you said, "Cures, micro needles deliver serum into the dermis for better skin." They're like, "Okay, I've got that information, I banked it." Great.
Then they move on, they stop scrolling, or they scroll away. Okay, so see the difference? Open loop, closed loop. So there we go. This is my quote from last module, but I couldn't remember. I said it was either Halbert or cables, but it's not sugar. Every element of the advertisement must cause the reader to read the next sentence, so that works with advertorials.
That's every piece of your copy, and it includes videos. Just substitute the word "read" for "listen" to... Okay? So he calls it the slippery slide. So once the readers start, every sentence pulls them towards the next.
Open loops are the mechanisms that make the slide slippery. So it's the thing that is... Because I've got an unanswered question, I need to keep reading to close that. Then I open another loop, and I open another loop, and I open another loop.
If you study some of the grades, they've written really long form, old school copy. We're talking 10-20 pages or 8,000-word sales letters. These crazy things that people used to do. That's what they would do.
That's how they would be hyper-relevant, targeted, and there would be loop after loop which they open and close and then weave in another one, pulling the reader through that piece of writing. So what's the clickbait trap? An open loop only works if the answers connect to your product.
If it doesn't or you leave the loop open without paying it off, you create a clickbait trap, and clickbait trap can get you easy wins on the front end. So a really clickbait article or a really clickbait ad will probably have a really high hook rate, but then it will have a very poor hold rate, and you're going to leave people angry and dissatisfied and frustrated and kill trust.

So you'll see a lot of... Sadly, there's a lot of brands in the ECOM space right now that put as on that they really shouldn't be running, and they have a lot of very clickbait-style stuff, and they have very low Trustpilot scores because of it.
They are now trapped in this loop of constantly having to find new customers because their attention is so poor, because they have deceived the customers they've already had. If you want a business that's going to last, build credibility, grow, be recommended, and be something you can ideally exit in the future,
that's what you're looking to do. You need to treat this with respect. Don't click bait people. So, a click bait might be, "I can't believe what happens when she puts this on her face." But if there's not a payoff, right? That could be a great hook.
But if there's not a payoff, then people are going to be frustrated. The loop is strong, but the art has nothing to do with why the product works. So people feel tricked. Strategic curiosity might be your serum isn't reaching where the layers are where agent happens. Here's what does...
So it opens a loop around the mechanism and that connects and that makes more sense. So it might not have the excitement of this one unless this one actually works, but it has a payoff that is meaningful for that customer and that's where you get results.
It's often in the mundane, simple connecting the dots. For people, that's where results actually live. We all like to think it's in extravagance. It's generally not. People have problems they're trying to deal with. They want solutions they understand are going to work. People are inherently quite simple.
So does closing the loop naturally lead to understanding why this product is the answer? That's a key component in figuring out whether you're being a bit too click bait or not. Now I will say that for every rule, there is a reversal click bait as well. If one experiment you can run is what's the most outrageous thing I can say about my product that I can pay off,
and if you can do that and I don't suggest doing it all the time, but if it's sprinkled in a few little places, you run a couple of banks like this, that can pay off really well. But it's not a default, and it's not something you should rely on.
So what are the five types of open loops? So the most obvious one is the unanswered question. So why doesn't serum work off the 40? Why does it work? I want to know the answer to that. You're directly asking a question that the reader wants the AI to... It doesn't have to be any more clever than that, as long as it's super relevant to your audience. The incomplete reveal, this one where it works really well and like TikTok hours and Google Sheets when you've got someone talking... There's one thing dermatologists know that skincare brands don't tell you, and I'm going to reveal it right now.
So it promises information, but it withholds the key detail. So people are like, "Okay, right? This guy's got my attention." This guy's got my attention or whatever. I'm invested. Now I want to know what's going on. There's the unexpected claim.
So most skincare products make your skin worse over time. So this is where you state something that is contradictory to what they already might think or believe, and it challenges their beliefs in a way that's exciting and intriguing.
Like, "Wow. Maybe I'm wrong. I need to know if this is true and why it's true." There's the story interrupt, right? So three weeks in, I nearly threw it away. Then I noticed something.

You start in the middle of a story and create a moment of tension where it's like, "Wow. I've just been dropped in here, parachuting into the middle of this conversation." She was trying this thing for three weeks,
and she was about to fly away. But then something changed, and I was going on that creates curiosity. Then there's the mechanism tease, right? So there's a layer of skin your products have never reached, and it's like "intro." It introduces a concept that requires... "That sounds interesting. I'm invested in learning more about this, but I need the explanation. I'm going to stay because I want to know more about this."
Okay, so there are five types of really good loops. So if we're talking about ad copy or longer form copy, you're using multiple loops. If you've got a 45-second video ad, you might have one, maybe two loops, maximum. You've got a lot to cover in a short space of time when you're writing on form copy outputorials or whatever. Often, your subheadings in each section, each block of copy, as we call them, will open a new loop.
That's when I discovered something my doctor had never told me before. This new way of approaching the skin was different to anything else I tried. It's opening a loop. So, for example, in this one, a loop opens. Your skin routine is missing one step.
Okay, that's okay, what step is it missing? It's the reason your serums don't work. Okay, so what is that reason? The missing step is delivery. So now I've paid off my first open loop by explaining the missing one step is the delivery, but not the way you think. Now I've opened another loop, right?
So I'm constantly having this person think and assume and try to fill in the gaps, and they want to listen because they want those questions answered. Serum fails because they sit on the epidermis. Microchannels change where the serum goes. Want to see how super short at? Very concise, and obviously, I haven't pulled out some of the filler copy in between, but open loop, close a loop, open loop, pay off a loop. We're constantly getting that person to engage and reengage with the ad to close those loops to get the information that we've dangled the carrot out there, and then we're letting them take the buy, right?
That's what we're trying to do when we're talking about managing open loops and the best copyrights. If you go and study the greats, if you go and study Halbert, Gary Benson, anger like John Benson, who else is right up there? Joe Sugarman's phenomenal. Dan Kennedy, even Alex Kmosi, phenomenal. Copyright actually. You will see that they do this continually, opening loops, closing loops, opening loops, closing loops, and they do it in very simple terms that keeps you engaged consistently throughout.
So we all know that different platforms have different scroll behaviors. These are very broad observations, so take them with a pinch of salt. But this is what we're looking at. So with a meta feed static...
So static image ad, the image is doing the interruption. Okay, so if it was a top of funnel static image ad, you might have a native-looking image. So it's something that looks like it's been snipped out of a magazine, a close-up of something that doesn't look... At all because you're starting the customer on a journey for a story.
That's how we're getting them in. If it was a bottom of funnel ad where we have a highly aware audience, it might be focused on really clean pictures of the product, great sale kind of thing. 40% off today. That right, but the image does interrupt the text overlays, the hook, and then the body copy is the loop.

So that's the format. The image stops you. The text on the image is what hooks you, and then the body copy is what sells. You want with a meta feed video, you've got the visual pattern interrupting in frame one, so that's your thumb stop. You've got your text on your screen.
So I like to call this the triple-three hook, which is where you've got the audio, the text on screen, plus the thumbs-stop image. Those three components work together. Okay. So often people have their feeds on it. Must catch their attention so they want to... On YouTube, Reels, and TikTok are full-screen verticals, so a face or action frame one works well because when someone looks like they're going to tell us something, we automatically want to listen to that. We're communicative beings.
Okay? Story so tappable formats you got one screen to stop tap through, one line, one image and make it easy to consume that kind of thing. Then obviously email subjects lines. The hook is the subject line.
If no one opens it, none reach your email. No one cares about what your offer is. So the subject line and preview line working together need to create a reason to open it. Curiosity. That's your loop.
Okay, so what are the big mistakes people make? So closing the loop too early. So if you answer the question, if you say there's one thing you don't know about skincare, this is the thing, then there's no reason to continue watching.
It's like my curiosity has been satiated. I'm fulfilled. I've got my answer. I'm going to see you later. So you want to delay the answer and build towards it. State number two is opening a loop you never close. This is the biggest way to kill trust and get massive frustration.
So lots of click bait to do this. They're like, "Make a promise at the start and then they never pay it off." You watch the whole video and then you just feel like your time has been stolen from you because we all understand that there's a tradeoff that takes place, right? It's like, "I give you my time, you give me my answer." That's what we've agreed to. You haven't done that. So opening a loop your product can't close.
So this is lots of brands where it now does this where it's like, "Lose seven pounds in seven days" or something you've served, right? Well, no product can do that. I mean, if you lost seven pounds in seven days, I'd be very medically concerned for your health.
So you don't want to over promise or create clickbait hooks that have nothing to do with what you're actually offering in terms of a solution. You don't want to have too many loops open at once.
So the idea is that if you open a new loop, it's because you've closed the previous loop, right? The maximum number of loops you want to have running at one time is 2. If it's a long piece of copy, you might have one big loop that you have to read through the whole article to close. Then you've got lots of mini loops that you open and close throughout it.
Okay, and using the same loop structure... If every ad starts, nobody told you this. Then people get wise to that pretty quickly. So look at what people are doing in your industry, what are competitors doing? What are people in adjacent categories to you doing? Do it if it's underserved, experiment with it.
If it's overused and kind of saturated, try and avoid it, because otherwise you just drown out. You're drowned out by the white noise of everyone else. So, the first second would be like a visual interrupt pattern interrupts your serials aren't reaching where aging happens, right?

That's op one, right? Where is aging happening and what's really going on? Everything you've applied sits on this layer. Points like this layer. Right? Aging actually happens here, deep up, right? Deep up.
So I've closed loop 1 and I've opened loop 2, so how do I reach it, right? If it's happening deeper, how do I get there? That's why 3 years of skincare didn't change anything. The delivery was wrong, not the ingredients.
Right? So I set up the close for loop 1 and now I closed loop 1 and my reframe from the previous modules lands because I've satisfied that person's curiosity. Then op 2 closes. Next these 24 gold micro needled create channels. The serum goes under, not on top. Through the skin, not on top. I super short.
Right? So two loops opened and closed within 15 seconds right here, and each one is making me go, "Okay, so I want the answer to that. You've given me the answer to that. That builds my trust. That builds your credibility.
Because you're making promises, but you're paying them off. So when you're doing an in-VSL, for example, if you're running an ad that's three minutes or more, you might want to have a couple of quick wins at the start.
So open some loops and close them quickly. It's the same reason game theory fascinates me. So if you're not clued up on game theory, go and read game theory. Game theory is like when you play a video game, right? When you play a video game, when you progress through your levels at the start, your character is useless. They can't do very much.
But very quickly, within 15 minutes to an hour of playing, you can suddenly do a whole bunch of other stuff. There's massive progression in the first 15 minutes to an hour of most video games in terms of what you can do, the skills, the options, the availability, all of this after you complete the tutorial phase.
That's because when you have received the gratification, you've got some quick wins. If the next win takes a little longer, your patience is there because the game has already proven to you that it will pay off on its promise.
It's just now you need to be a bit more patient. VSIs work the same way if you open loops early on and then close them early on, then you can spend the next minute before you close the next loop because you have built trust with that person who's watching and just be aware of that as well.
So how do we test the quality of a loop? Does the loop create genuine curiosity? So if the answer is super obvious and it means that the loop's going to be weak, don't try and pitch something like, "My God, have you ever heard of this cream you can put on that actually protects you from the sun?"
Yeah, sun cream, it's been around for 30, 40, or 50 years now, right? You're not... You're just going to leave people disappointed, thinking you're an idiot. Don't think that. Does closing the loop lead to the product?
Okay, so if the answer to closing the loop has nothing to do with the product, then you've got a disconnect there. You're clicking people, they're like, "Why am I watching this? Why should I care?" Is a loop appropriate for the awareness level?
So a mechanism loop will confuse an unaware audience. They don't even know what they should be concerned about yet and why it matters to them. So you're telling them about how

your product is completely different to anything else they've seen. They haven't seen anything. There's going to be a disconnect.
So a simple question will bore a product-aware audience as well, right? There has to be a match between the loop and the levels. Where is the person at? What kind of loops are they going to care about? How do I make my loops relevant to that person? Does the loop close before the CTA?
So if they get to the end of your video and there's an unanswered question, they're going to be pissed. They're not going to like that. They're going to feel unsatisfied. They're going to feel like they haven't got the value they wanted.
It leaves them in limbo. It's going to kill the effectiveness of the route. Then could a competitor use this exact same loop? Okay, so in many cases, there's going to be overlap, right?
But if your loop is built on your insights and not just something you've pulled out of the air, it will be much less likely that a competitor is using the exact same one. So it should be your specific mechanism. Your customer psychology from your research and your insights. That gives you an advantage.
If you just give AI a prompt and say, "This is where I'm at with no insights, no mechanism, no customer psychology." You're going to get the same one everyone else that has done that has got. Whereas if you feed it all this information, you get something unique.
Okay, so a hook with a genuine loop. So one hook with an open loop. The hook creates a question. The loop identifies, right? The answer connects to your product. That's what we're aiming for here.
So the loop type named... Which of the five types of loop are you using? Where in your copy does the loop close? What sentence is the one that delivers the answer? You want all five questions answered. Genuine curiosity leads to the product at the right awareness level and closes before the CTA. That's your checklist. Does it create genuine curiosity? Does it lead to the product? Is it at the right awareness level or does it close before the CTA? Is it competitive proof so not generic? Basically the same hook adapted for two platforms so videoscript and static. This will show you how a loop can work in different formats.
So can I put it as text? Can I put it as videos like scripting? Can I diversify the mediums in which I'm presenting this hook? So the hook and open loop working together is going to create a very powerful opening.
So of three to five seconds of your ad. That's what we're aiming to do. So take away from today is open the loop, delay the close and make them need the next sentence. Because if your copy isn't progressing people towards a sale, then it's not doing what it needs to be doing. It needs to be educating, progressing, moving people through that slippery slide method that Joe Strickman talks about. Moving people towards the sale. Every sentence should make them want to listen to the next one and the next one. Every word, every sentence they read should bring them further down.
So they keep wanting to consume that content. They get better education. Their objections are handled, they understand your product better, and when it comes to a buying decision, they're more prepared to take it.
Next up is "Show don't tell" in direct response. This is really interesting to me because I think it's one of the easiest ways to massively improve the quality of your copy is by identifying all your

show sentences or your tell sentences and changing them to show sentences, because showing proof will always be more valuable than telling someone something worked. So we're going to get into that next.

Transcript 18

David Briggs | 00:13
Hey guys, and welcome to Module 18, a new location. Same great quality. Yeah, I'm in my lounge instead of my office, but we can continue on from here. So today we're looking at story as persuasion. Now, humanity has used storytelling for eons.
Before we even had the written word, going back to Sanskrit and all that kind of stuff. People would pass on stories around campfires, and pass on knowledge from generation to generation. That's how we've been able to evolve as a species.
Then unlocking the written word helped us progress storytelling even further. Now we're able to absorb knowledge from generations and different places, in different locations or through the power of storytelling. Indirect response storytelling is a little bit different because we're not telling stories to perform, we're telling stories as a delivery system. They are a vehicle for our message, and because we are hardwired to absorb stories and be responsive to stories, they make a very powerful vehicle.
So let's take a look at it. So claims will get scrolled past, stories get watched. You'll see claims on park benches, buses, billboards, and ads all the time. It just becomes white noise because a claim is a gives you an objective response. I either agree with the claim or I disagree with the claim. I can make that assessment very quickly and then I can move on. Whereas a story invites someone to become immersed in your world and your experience.
It asks them to follow. Then by the time you've developed and explained the mechanism, they've already accepted the premise because they bought into their identity and the storytelling. So story in DR, just to reiterate, is not for entertainment. It can be entertaining, but the purpose of it is not entertainment, it is a vehicle to deliver proof mechanism, identity, and to further people towards the purchasing decision.
So Mark Ford and John Ford in great leads. Again, I've said about this before, get a copy. Totally worth it. A great story lead, which is one of several leads that they talk about, is the closest thing in direct response to a Trojan horse.
Why is that? Because people allow a story into their lives. This is why some of the greatest marketers of our time, people like Alex Tomozi, people like Frank Kern, these really like Gary V, do a lot of storytelling because they know through a story they can get their message through in a way that is going to stick.
Interestingly, I think there were about nine. So in all of human history, there are about nine different types of stories. And every single story ever written falls into one of those categories, like the Hero's Journey, the search for truth. All kinds of things, right?
That goes from the greatest stories ever written, like the Iliad and the Odyssey back in ancient Greek times right through to modern classics like the Russian greats, War and Peace and modern greats like Lord of the Rings right up to modern-day classics like Metamorphosis and things like that. They all fall into one of those categories.
But there are three specific story arcs that sell really well, and these are ones that we use all the time in copywriting that you should be using to... The first one is against all odds. This is the idea that someone or either the founder or the customer they faced, they were their backwards against the wall, right? They tried everything, nothing had worked, and then they find this

breakthrough and now they have it so you can have it too. They want to share it, they don't want to gatekeep the second one is real-world desperation.
That is where there's a specific moment of pain, an absolute worst-case scenario where it's the doctor's office. Maybe they're lying on the bathroom floor, they've fallen, and they can't get up. The story starts in that moment of basically addressing someone's greatest fear.
Then there's the discovery story, like an unexpected source led to a non-obvious mechanism. So for example, a lot of brands that use the narrative of natural ingredients, so like beef tallow brands, holistic medicines, herbal remedies, a Yurdovic kind of medicines, right?
It's a non-obvious mechanism. It's like we progressed all this way through science and all of this. But actually, let's look at what Grandma did and what her Grandma did. Why did they look so great? Why were they so healthy? Why were they so strong?
So the curiosity opens the loop and the mechanism closes it. Your story is the packaging that you deliver. All those components through your mechanism, your proof, your belief shifts, they all come through woven into that story.
Okay, so what's the difference? So this is the difference between content writing and copywriting. Okay, there's a lot of overlap, and a lot of people get confused about this. Content writing is for entertainment engagement. The purpose of content writing is not to drive someone to take an action.
So it can be a really pretty story. It can be a big payoff at the end. It can often include a lot of emotion just for the sake of emotion. Typically, the reader will admire the person telling the story or the writer, and they won't connect the fact that they have achieved their goals because of a mechanism and proof.
There won't typically be a CTA right in a persuasion story. We're direct response copywriting. Each beat earns the next sentence. So we are progressing someone through a way of thinking. We are bringing them towards a mechanism, a reveal, the proof, the call to action through the storytelling. There is a purpose behind it.
If you are writing direct response stories, then by the time you come to the end of it, if you can take away the mechanism and all of the product stuff, and you've still got a story that's just a piece of entertainment. The mechanism and product information and belief shifts, and that should be fundamental to the story.
So if you can have a story without them, you've just written entertainment. You need to go back and rework it because the direct response elements, the mechanism, and all of these things are the pillars that should be holding up your story.
If it can stand up on its own, then you're back over here writing content when you need to be focusing on writing copy. So a story as well. It doesn't have to be an epic, right? It doesn't have to be the Iliad or War and Peace. You can tell a story very quickly.
Okay? It can be 60 seconds. It could be, for example, a real right. The story could be Dad playing football with his son, his knee buckles, he can't get up, it's really embarrassing. He's thinking, "I'm only 40. Why am I doing this? Not being able to get up off the floor? This is humiliating, and I've embarrassed myself and my son."
Then it could go into the mechanism reveal, right? So maybe he already wears a knee brace, and he didn't realize that the knee brace was strangling the joint. It wasn't healing because it was restricting blood flow.

So he moved to something else, and that allows the blood to circulate. Now he's back on the field. He's feeling strong, he's feeling fit, he's able to play with his kids. He's like the hero dad they're all looking up to.
That's the most basic story, very linear, one point throughout. Let's just tell the story and frame it in a way that makes it relatable. The second is the as story. Now this is like the full arc.
If you've been on any of my live calls, you'll know that I talk about this quite a lot because a lot of very successful abortorials followed this structure, so it often has a setup. So there'll be some storytelling at the start that sets the scene, makes it relatable, believable, and then it'll go through certain beats.
So typically there'll be a problem, agitate, breaking point. So this is the problem I'm facing. This is what it really meant in the context of my real life. This is when it got so bad. I had to do something about it.
Then it will have the search for the truth, which is the turning point. That's when it's like everything I tried up till now wasn't helping. Or I knew I needed to do something about this. Now I search for something, and that's when I come across this thing. I discover what's really happening, the unique mechanism of my problem.
I find something that is a unique mechanism of the solution. So now I know what's really going on. How do I find a product that delivers the result? I need to fix that problem. Then, you go into how the product delivers that proof reversal, etc.
Okay, the last kind of storytelling is the vs L story. So this can be like layered scenes. It can be multifaceted, and you can often have longer explanations. So a great place to look for VSLS is to find brands that run VSLS. You go on Anthropic, you search by longest video length, and you look for brands that have "watch more" or "learn more" buttons. Typically, if it's "learn more," it'll take you to an advertorial or a VSL. Now they will have lots of belief shifts woven in.
So it might be, "I thought this, and then this is what changed it." There might be a two- to three-minute explanation of why that's not true and why that doesn't work. It will have multiple open loops. These are very complex pieces of copy. Founder stories work really well when you talk someone through what led them to make this decision because it builds credibility around the brand.
So one story can be very short, extended, or really long, depending on how you choose to frame it. Typically, you want to start with a short version, and then if that's successful, you can expand on that. There is a weird phenomenon at the moment that people think long copy is... Every copy needs to be short and punchy. It needs to be effective. Long copy works when it's highly relevant, when it's at the right sophistication level, when it's speaking to the right audience, and it's at the right awareness level. People will quite happily sit and watch movies, play video games, speak on the phone.
If it engages them, offers them value, then they will engage with it. So, like his Creed Discovery arc, for example. Maybe someone had tried every serum on the shelf. Nothing reached deep enough. Her skin still looked tired. The turning point is finding out why.
Well, now I've looked into it, I've found some research that shows that most products just sit on the surface. They're never getting past the skin barrier. That's my turning point. Then an introduction to the mechanism.

Well, 24 karat gold micro needles open up micro channels in the skin, and the serum can get to where it needs to go. No longer is that skin barrier an issue because we have found a mechanism that bypasses it.
Then the payoff would be two minutes a day at home. The results her dermatologists used to charge for. That led to Matt and Christina's brand, which is now worth over $90 million. The mechanism is wrapped in a story.
You can elaborate on this as much as you want. This is the skeleton of the story that you would then put the storytelling elements around. Okay, so for example, a pain relief brand, we went with "Real World Desperation." My knee buckled picking up my daughter at the park. I'm 43. I shouldn't be the dad on the bench now. I'm 37 now. I'm not far off my forties, and I don't want to be that guy. I go to the gym. Not as much as I should, or I would like to, because my time management skills aren't very good.
But I go to the gym because I want to be able to walk my daughters down the aisle. I want to be fit and strong. If something breaks at their first flat or they need someone to drive for three hours to pick them up from some party at university or whatever, I want to be fit, strong, healthy, and mentally prepared to do those things.
So this is very reliable to me. This is a fear I have. So other men around this age are going to feel something similar. So there's no fitness flex, there's no before and after. It's just a moment in time where people of a similar age to me and just older are going to recognize themselves in the story. This is for most men. That feeling of being weak or incompetent or unable to protect or provide is a very real and visceral fear.
Because we spoke to that, we were able to generate a very powerful advertorial that really spoke to the target audience. So the story was doing the targeting. So how do you build a story that sells? You find that moment, what is that single scene where the problem became unbearable?
It's not a montage of all the worst hits so far. It's one frame, one moment frozen in time, and then you want to pick the arc. So which one fits best? Is it against all lots? Is it real-world desperation or is it discovery? You want to choose one that fits the audience.
Hello, what's going on with me? She wants to go inside the washinger. Wonderful.
So yeah, pick the arc right, which one best fits the audience's belief? Where are they at? If it's pain relief niche or something like that, then real-world desperation can really hit the heart.
If it's people that have a lot of burnout, it can be discovery. If you're someone that's been dealing with hormone or cystic acne or something like that, then chances are you've been burned by physically sometimes as well as metaphorically by a lot of products in the past that have promised this fix. Or that fix.
Many of them have horrible side effects. It's really stressful. Obviously, acne isn't typically life-threatening or anything like that, but it's your face, it's your body, you can't hide from it, you can't cover it up.
It's embarrassing, it can affect self-esteem. So an against all odds or a discovery story might fit well there. Then you want to plant the mechanism. So halfway through, the mechanism becomes the answer. You don't want to reveal it too early, otherwise you start to get pitchy and salesy. It should just be a natural progression.

After trying all these things, I finally found this thing, and this is why it worked. Then earn the proof. So numbers, names, and dates. The story is the wrapper. The proof is the payload. They should be in there in a way that is natural and native.
I checked out, and there were 15,000 reviews that were all saying that they'd had the same problems with me, and they'd tried XY and Z. Call them out by name, make it relative, or nothing works.
Then land on identity. So end on who they become, not what they buy, because you are selling the best version of themselves. The product is just the vehicle that helps them achieve that. So the arc can change, it can bend and move, but they're the touchpoints.
When you start analyzing good copy, you'll notice that really good copy will almost always hit on these touchpoints. So you can use AI to compress, not to invent. So here's the founder origin, you can paste it in. Here is the avatar, paste it in. Here is our mechanism, paste it in. Give me three 92nd story-driven hooks: one against all odds, one a real-world desperation, and one discovery open on a single moment. Plant the mechanism halfway, and end on identity. Use contraction. SFTH Grade reading level no. Marketing language no. Imagined no. Introducing no. Okay, this will help you see what you can capably do when you bring those pieces together. You use your research from the other previous modules. You know what's there. You know what you've done and covered belief shifts customer research. Customer research is the absolute golden goose for finding the moment because they will tell you what their moment is already, they will share it.
Okay, so how did you write a story-driven hook and body? Pick one of the three arcs for your brand and your avatar. Write a 15-second hook built on a single moment, and expand to a 300-word ad body, and then plant the mechanism as the midpoint.
So by midway through, you should be getting into your mechanism. Reveal and then end on identity, not on the offer. The CTA will carry the offer. The copy needs to end on the identity and then read it out loud. The rule is if you trip when you read it out loud, rewrite the line.
Okay, so the story is the wrapper, and all those components are inside that wrapper, and they should naturally progress one to the other. So remember, stories are wrappers, mechanisms are gifts, read really good story-driven copy. There are lots and lots of brands running very good atorials right now. Unaware and problem-aware top funnel advertorials typically have the best storytelling, so that's what you should be looking for. The next module is module 19, writing at the right level, and that is up next. Speak soon, guys.

Transcript 19

David Briggs | 00:00
The new e-comm copy.
Hey guys, we are at module 19 of the Newcom Architects Copy course, and we're talking about writing at the right level. I work with a lot of European brands, and one thing that I spend a lot of my time doing for these European brands is dumbing down their language. Some people might assume that because people learn English as a second language, they don't have mastery of it. Actually, when you learn a second language, you typically learn it in a very formal way, and that's why it comes across as not being native.
So I actually spend a lot of time for my non-English-speaking clients dumbing down their language and making it simpler and making it sound more native. So it's not a lack of mastery. If anything, it's the opposite. There is a nativeness that comes from speaking a language where we use words in certain ways, and that varies massively, even amongst English-speaking countries. One time I was writing for an American skincare brand, and I said like a celebrity a lister.
They're like, "What's an a lister?" It's such a common term here in the UK because we don't typically say Hollywood or anything like that. We would say they are an a lister, whereas in America, the common phrase would be like red carpet, Hollywood, Hollywood elite, something like that.
So even within English-speaking countries, there are differences in language and word choices that can make something sound native and real or jarring and confusing. So bear that in mind. If they've got to translate what you're saying or spend time figuring it out, you've lost them.
Again, this isn't an intelligence thing. This isn't because your audience is stupid. This could be engineers, doctors, lawyers, marketers, whoever. Write could be highly intelligent people. They are busy, they are distracted, they don't owe you anything. You've put an ad in front of them.
So you need to make your point clearly because you're trying to get their custom, and of course, you're trying to fix their problem, but at the time, they don't know that. And if they've got to try and figure it out, you're going to lose them.
Okay? So let's get into writing at the right level, okay? So clarity over cleverness is like a golden rule. It really is. All of us copywriters, me included, when you start out writing, you think you've got to be really quippy and smart and all of this.
Then you very quickly get brought down to earth by a mentor who goes, "You could have said that in the sentence. Why is it a whole paragraph who you're trying to impress?" So it's not smart copy that sells.
It's clear copy that sells. As I said, the readers half pay attention. They're scrolling their phone, they're on the couch, they're watching TV, the kids in the background, dinners on the stove, whatever it is, right? They're not impressed by your vocabulary. They're not looking for literary flare. They want to know what's in it for them, and they want to know it as quickly as possible, and they want it in words their kids would understand. Again, that's not an intelligence thing.
That is a get to the point thing. So module 15, we looked to the hook earn in the next sentence. This module keeps every sentence after it frictionless. So going back to that module, we talked about the slippery slide and how every sentence should lead into the next one.

That's what we're looking for. There's going to be a couple of extra things I add into this. So each sentence has one purpose to get you to read the next one. Okay, friction in any sentence breaks the slot. Big words create friction because they require you to go through your internal database. What does that really mean? Why did they say that instead of just a simpler word? When you're asking people to think, you're creating friction, you're putting barriers up. That makes their job more difficult to progress.

So there are four levers that lower that level. Okay, so module 8 told you to write to one person. These are the four leaves that keep the person reading or listening. So the first one was sixth-grade words.

One of the telltale signs of a master copywriter, someone who's really good at their craft, is that they can take a very complicated idea but explain it like a ten-year-old. Explain it to a ten-year-old.

So there's a really good subreddit called "Explain it to me like I'm 10." There are people that ask questions about medical devices or certain situations or whatever. Then the object of the people that engage with that thread is to explain it like they're ten years old.

If you ever need to know what that looks like, it is such a good resource. It shows how you can distill very complex ideas into very simple options. A lot of the time it's analogies. Think of it like this. Imagine you are doing X and you're the...

Then it clicks with people, right? Don't use words that are just unnecessarily complex. You don't need to say facilitate, help is fine, you don't need to say optimal, best is good enough. They mean... They have a similar, fundamentally the same meaning.

They're much easier for our brains to comprehend and digest. Use contractions, right? Don't "won't," "it's," "should've," "were," "that's" how people talk. We use contractions all the time because that's just what we do.

If you start using "don't" unless you are making a very strong point like "don't do this if you want to XYZ" you can use them for emphasis, but typically if you use them throughout your writing, it sounds like a press release, it sounds like something the president's going to read or whatever, right? The prime minister is going to stand up and say, "We have decided that we are going to write it." It sounds fake and overly formal, and that triggers a different part of our brain. Short sentence rhythm.

Okay. One of the biggest telltale signs of AI...

Sorry. Yes. So... Short sentences and rhythm. One of the biggest telltale signs of AI is how uniformly it writes. So as someone that uses it on a daily basis and was a very early adopter of it, I can spot it far more readily than most people. Even when it's used well, because there are still things people forget to do.

One of the things is uniform. What I mean by that is you will get a 16-word sentence followed by an 18-word sentence followed by a 20-word sentence followed by a 17-word sentence. Typical speech doesn't follow those patterns. We talk in choppy ways.

When we want to get engagement, we vary the length. So you might say something short and pause. Then, once you're sure you've got someone's attention, you can build, and you can lead with longer sentences.

Then, when you really want to emphasize something, you go back to short again so you can see... I'm just doing this with my voice. But human speech and human interaction vary. It goes up and down in length.

So you want to vary that as well. In Britain, it's just as important. People recognize patterns. So if you write an editorial that's like two sentences, your brain is already getting bored. It is recognizing the pattern and going, "I don't want to read that." Whereas if it's like a three-word sentence and then a one-and-a-half-line sentence and mobile, then a short paragraph, the variation keeps you engaged.
So it works with white space on a page just as well as it does in actual auditory speech. You want one idea per sentence, right? If you try and shove two ideas in one sentence, then your brain can't determine which one it should really be caring about.
So you want one idea, and then you want to move on. And one of the hardest things because it seems counterintuitive, one of the hardest things to do in copy is to focus on the rule of one, one big idea, one angle, one customer, one avatar. All of this because lots of people think, well, surely I want to be as broad as possible. I want to try and speak to as many people as possible. Not because when you do that, when you try and appeal to everyone, you end up appealing to nobody because no one feels like they are being specifically identified. You don't want to broadcast, you want to converse.
So, for example, my battery's running low. Same product, two different reading levels. Right? So before here we've got the supplement facilitates metabolic function, supports the body's natural thermogenic processes for optimal results. It reads like a label on a drug package.
That's convincing. No one of anything. It's hard to process, it doesn't feel human, it's appealing to the logical part of my brain. It's confusing, whereas I could word that exact same thing as "This tells your body to burn fat instead of storing it."
That's it. 1 pill. 2 minutes a day. Now, which one of those would you feel more appealing to you? It's pretty simple. So remember...
I remember going back to module 17, we said, "Show, don't tell." This module was really carrying that on. It's like when you show it in words that your reader isn't having to translate. Okay, so same product, two reading levels, one's going to get attention and appeal. One's going to be confusing as well. So yeah, if there's a simpler word that makes the same point, use the simpler word, don't use facilitate, use help, don't say utilize, say use, don't say optimal, say best, don't say demonstrate, show. There is almost always a simpler way to say things.
If you think about experts that you come across, people like doctors and lawyers and stuff, one of their biggest art forms is that they do this by default. So a doctor might know exactly what kind of...
Well, I would hope the doctor would know exactly what kind of medical issue is. But when they're telling it to the patient, it's critical the patient understands. So they will use words. The simplest words they can find. Despite having the knowledge, the vocabulary, and the medical expertise to explain that your copy is doing the same thing.
You know the ins and outs of that product, how it works, but how do you communicate that in the simplest possible terms? So the person listening or watching or reading or whatever goes, "Wow." But that clicks with me. I get it.
So plain words would always outperform clever words, right? We're not trying to get admiration for our literary genius. We're trying to sell products to the right people without getting refunds. So we want them to understand it, be confident in it, and know what it does and why it's for them.

Okay? So one of my roles is... I still do this to this day, and I often still feel a bit silly doing it, but read it out loud. If you get to a phrase that feels awkward or trips you up or you're getting tongue-tied, rewrite it. Vary the length.
Okay, so short, then long enough to carry across through two clauses, then short again. That's how we speak. It's up and down, it's long, it's short, it's animated and very calm. You don't want tongue twists, so if your mouth fights the sentence, your eyes will too.
So for example, if you're starting with a subordinate applause and it's clumsy, get rid of it and you don't want it to sound like a corporate memo, right? It's not internal. Cons... Where HR... Where HR... Paed document. You are a human being speaking to another human being, so it should be stripped down until you sound like a person.
Okay, so in module 4, I introduced the read-aloud test. This is where you really put it into effect. Read it aloud, read it as a voice, not play it back to yourself. Does it sound weird? Because especially if you're going to pay someone to do the script, you want to iron out all the kinks you possibly can.
Otherwise, you're wasting time and money when they're like, "This is awkward. I can't say this right. It doesn't sound right." You can do all that ahead of time and be more effective and get better results.
So, for example, an athletic sock. Plain language, right? So for the first one, we have patented compression lock technology eliminates friction-induced epidermal abrasions during prolonged athletic activities.
That's a mouthful, right? The work in version is run all day, never get a blister. They mean effectively the same thing. So the CVR moved dramatically when we stopped trying to write like a scientific pamphlet and we started writing on what the customer actually cares about. This requires almost a translation tool.
So what the hell does that mean? I get that. This is why I want to be able to run all day and I never want to get a blister. Okay, so the reader didn't get smarter, the copy got clearer. We're meeting them where they are, giving them the information they want to know at a level they're ready to receive it.
So this is the kind of clarity edit pass you can paste things into. Heading away app. Super useful free talk. You chuck it in. If it's yellow or red, you rewrite it. It means it's far too high. So shorten the sentences, break them down, change the words, improve it, hunt for the four-syllable words. Okay, so most can be cut approximately. Should be about... Demonstor is show. So where can you replace complex words with simpler ones? Make the edits for contractions immediately by changing your will to you. It makes it sound more natural. You want to break long sentences down.
If there are two big ideas in a sentence, shorten it and then read it out loud. Okay, follow those. It sounds like a lot, but it becomes automatic very quickly. As soon as you start doing this regularly, you'll start to spot the patterns, the mistakes, and you'll be correcting them before they even happen. Then it just gets down to reading it aloud.
If I'm spotting errors, then I can go back to these previous steps. So as your reading level editor, here's my ad copy. Rewrite it at a sixth-grade level, right? That's why we wanted to use contractions. Vary sentence length, keep one idea per sentence. Cut every well a twelve-year-old wouldn't say. Keep the meaning, keep the proof, keep the CTA, don't add in marketing language, don't add "imagine," return the rewrite.

Plus a list of every word you swapped on what? AI is really good at editing because it can do that job very quickly for you. Then you become the copy chief. You read it out loud before you ship it. So pick one key piece of copy you've already written and go through this process. It could be an ad, could be an email, could be a section of a page. Run it through Hemingway, and note the grade level it started at.

If it started at a 13th-grade level, this is probably quite high brow. This is going to go over a lot of people's heads. Do that five-step editing process. Swap words, use contractions, break down sentences, look for rhythm, long and short sentences, vary it, and then read it aloud and then deliver the before and after side by side and note your final grade. This is just for you. I'm not going to be marking this.

If you went from a third-grade level to a 13th-grade level to a sixth-grade level, you've just massively improved. How many people are going to be able to receive and absorb that copy? Then think about what you cut and why, because that means you will get better at doing it in the future. The goal isn't grade-six copy.

That's the ballpark figure. The goal is frictionless copy. So can I simplify it to the point that is easier to understand, consume, read, and absorb? That's what I'm aiming for. So remember, smart copy doesn't sell, clear copy sells, and clarity will always be cleverness in this game that we play.

Next up, we've got handling objections in copy. See you there.

Transcript 20

David Briggs | 00:00
Twenty-two, you are two-thirds of the way through. This is the home stretch. So the next thing is handling objections in copy, right? What's an objection? Objection is a barrier to someone making a decision that moves them along their customer journey.
So you want to answer the real one, not the stated one. We covered that in an earlier module. So this is how you put that into practice. So let's take a look. So every reader is silently arguing with your copy. They're nodding while reading.
But underneath... They're in their mind. They're listing reasons not to buy, sounds too good to be true, probably won't work for me, I've tried this before. If your copy doesn't answer those real objections, the reader just leaves quietly. There's no reply. They just disappear. Module seven was about finding the real objections.
So this is how to answer it inside of the copy. Okay, so again, we're putting those threads together from our research, those foundation building blocks, and now we're able to weave it into super effective copy.
So the reader is not your friend, he is your prospect. He wants to be sold. But only if you can prove your case. Before he raises his own objections, this is from scientific advertising, not break-ro advertising.
Okay? So people are willing to be sold things, right? We live in a consumer society, we buy stuff every single day. It's not that people just want to be sold things that work for them, that they believe in before they can bring up the objections in their mind.
That's the key to this. So there are four main ways to handle objections, right? The first one is to preempt them. So raise objections before they do diffuse it, right? If... I mean, I talked about this in the previous module, but when I was younger, I used to get picked on for having ginger hair. A simple way around that was to preempt it. So I'd introduced myself as Ginger Dave. "Hey, I'm Ginger Dave. Nice to meet you." It broke the ice. It was a bit funny, and it meant that if anyone said Ginger in a negative way afterward, they looked foolish.
It's like, "I just said I'm Ginger Dave. What point are you trying to make?" It made them look foolish, so it was preempting. You can reframe. So you change the lens. The objection still exists, but now you have changed the way that they are contemplating it, seeing it, and what they are weighing that objection against. You can outprove the objection.
So stack your receipts, numbers, names, and demonstrations. Some objections only fall to evidence, right? So there is a certain point where some people get and they go, "Prove it, show me it works." Well, "Here's the proof." This is before and after. This is a bunch of people that have tried it. This is our study, this is the evidence.
Then ignore. So some objections don't deserve a reply. Typically, the ones that you ignore are made by people who are not a good fit for your products in the first place. When you object, when you deal with objections that should be ignored, you engage with them, which makes them real.
I've seen a lot of ad copy that says things like, "You might be skeptical." Well, they're trying to deal with an objection that should be ignored. Don't acknowledge skepticism, because there might be a lot of people that are reading that copy that weren't skeptical.

But now it's been said or written that maybe I should be skeptical. So you can just walk straight past that. You don't need to acknowledge skepticism. Everyone has skepticism about everything to varying degrees. You just handle the skepticism without shining a bright light on it.
So let's look at preemption. So preempting something is naming it before they do. So when do you want to use it? When the objection is quite obvious, when the reader will think it, whether you address it or not, it's unavoidable, basically.
So naming it first removes its power, which is exactly like my personal example I just gave a minute ago. So how it sounds, right? You've probably tried five products like this already. Most of them don't work. Here's why this one's different.
So I'm addressing that. I know that they've tried a bunch of stuff before. The reader is left thinking, "Okay, I'm going to listen to this." They're not just going to say, "Here's another thing." They're addressing that we've tried stuff before, it hasn't worked.
That's the door opening, right? So pre-empting works because it disarms skepticism without naming it. You do not have to use the word skepticism. I hate all these testimonials that you see that say, "I was skeptical at first."
Because I'm... I very rarely use the word skepticism. I might say, "I didn't think it was going to work." Or, "I thought I'd heard all of this before." I might use synonyms for skepticism, but I very rarely say skeptical.
So if it really reads... It's really artificial. Anything anyone that's ever generated AI testimonials, ideally for placeholders because you should be using real testimonials. You'll get one that says skepticism in it somewhere, and it just makes it sound fake and artificial.
So reframe is changing the lens. So their objection might be, "It's expensive." So trivialize the price, contextualize the price. The refrain would be, "It costs less than you spend each month on serums."
They're not doing anything. It's less than a cup of coffee a day, which is leaving you jittery and tired. This gives you lasting energy. It's less for a year for this product than it would be for one clinic visit, and you need to do at least six of those a year to get any real results. You don't argue with the objection. You change their perspective on the cost, the object, the example. Rori Sutherland gives in his lectures is the espresso pods.
I think I said this in module seven. Done. So many of these videos losing track. It doesn't hurt to have a refresher. Whereas the espresso pods you put, the ones you clamp down, you get a cup of coffee.
If that was price-anchored against a jar of instant coffee, you'd think it was phenomenally expensive. But they haven't price-anchored it against a store-bought coffee, and by comparison, this thing looks super cheap versus store-bought coffee.
So they have reframed. They have changed the lens through which that value is perceived, and then prove what matters. Ignore what doesn't. Okay, so does it work? Well, that's an objection that requires evidence. You can't convince someone something works if they are of the mindset where they think to improve it.
So numbers before and after third-party tests. Customer photos with names. UGC videos. Stack proof until your viewer is at a point where they can't refute it. There's so much evidence that they can't make that case anymore, yet clearly it does work. Will it work for you?

Well, maybe that's a different question. Then ignore things like "It's not for me." Some people who stumble across your ad, your product's just not going to be right for them. That's a call. We cannot sell to everyone. Everybody is not a top, right? We know who we should be targeting. So trying to convince people who were never the right audience for you is going to ultimately lead to a loss of sales. Working with me is very different to how you work with most copywriters, copy strategists, people of that style.

It's very personal. It's not "Let's do the scope." Here are the deliverables. It molds and changes, and that suits some businesses. It particularly suits businesses that require expertise across a range of touch points.

But if you were a big organization hiring for a very specific role, I would not be a good fit. I'm not going to try and convince someone that I am going to be a good fit for that, and I know that I'm not.

So when I talk to and engage with my clients, they know what I'm about and the value that I can bring, and it makes sense. I let the rest go. So let's take a look at a cure skincare example like preempting the drawer.

Okay, so the objection is she has a drawer of skincare devices already. Most don't get used. So why would this one be different? I've got my radio frequency wand, I've got my microcurrent device, I've got my XYZ.

Right, so we preempt it, we name the drawer in the... You probably bought three things like this. Let me tell you why they ended up here pointing to the drawer, okay? Then the pivot. The mechanism is different.

So this mechanism doesn't rely on surface stimulation, it doesn't rely on the skin barrier as the delivery vehicle. It passes through that to where it can actually work. Then the result is a $90 million grant. The objection becomes the hook, right? We have given people a reason to believe, but we have met them where they're at, and we have dealt with skepticism without naming it, and we have created a shared experience through identity. We are challenging that objection head on, and because we have done that and acknowledged it and validated it, they are able to move past it.

So the strongest preamps name what the reader is already thinking. Don't be afraid to call it out, right? You probably TED a stack of supplements like this. Well, I'm telling you right now, they're using this when they really should be using this. They're using refined supplement when they should be using pure resin. Whatever. There's a refrain.

Okay, so the objection passes. So you want to run this on every piece of copy that you're doing. So list the top three real objections. You've already mapped them, and that's why we do all the foundation work at the beginning.

So stated objection on the left, what it really means on the right, and then pick a strategy for each. Are you going to preempt it? Are you going to reframe it? Are you going to prove/show proof against it? Why? Are you just going to ignore it? Is it an objection that actually is not worth your time?

Then match the strategy to the objection type. Write each handle in the copy. So preempts go early, reframes go near the price, and then proof goes near any claims you're making, ignores, and then read the draft as the skeptic.

So reread it as the customer who might have those objections. Imagine you don't believe a word of what's been put in front of you, right? You're completely against it. Where would you push back against what's being said?

That's another place that you can add another handle, another objection, a stamping piece of copy, and then cut anything that creates a new objection. So some lines like "If you overcomplicate an explanation, you can leave people with more questions." More questions create more objections.

If you're overexplaining, overcomplicating something, cut it. You don't want to be left having more objections that you have now created to defend. So module 12, we talked about the beliefs that break.

So this is how we do that. We identify the objections, we establish what those customers already believe, and then we can handle those objections within our copy. So you can use AI to find what you missed as well.

So here's my ad copy. Here's my avatar. Read this as a skeptical buyer who has been burned before, give me every objection a real reader would silently raise line by line for each one. Mark whether the copy currently handles it, preempts, reframe, prove, ignore, or leaves it open. Flag the three biggest unhandled objections in priority order. Don't rewrite, just diagnose. Be careful with prompts like this because sometimes... Because you've asked it to look for something, it will find things that don't necessarily make sense or remember. You are still the strategist, you are still the thinker, but this might help you pick out things you've overlooked.

So AI can be brutal at this, but it can be artificially brutal. AI is a confirmation-biased tool. It will feed whatever you start it off with. So if you put an ad in, you have... This is the greatest ad ever. Tell me why it's the greatest ad ever.

That's what it will do if you put that same ad in and say, "This is the worst ad ever. Tell me why it's the worst ad ever." It will feed that. So be wary when using this and make sure you are using your critical marketing eye to identify where it's right, where it's wrong.

So here's something you can do. Do an objection pass on a piece of your existing copy. Pull a piece of your own copy. Add a tutorial page section doesn't matter. Something that's relevant, ideally something that's already getting traffic where cleaning it up could make an impact.

Then list the top three real objections from your module 7 objection map right, and pick a strategy for each. So do we preempt it? Do we reframe? Do we prove or do we ignore? What strategy is going to be the best fit to handle this objection?

Then rewrite any relevant lines so each handle lives inside the copy. You have handled it. Then look at the before and after. Right? Compare them side by side. The second piece, where you've handled the objections, should leave someone thinking, "Wow, I've really got no objections anymore.

I've got no questions to ask. The way I picture it in my head is like if you are looking at a 100-meter track in front of you and you've got hurdles in front of you and objections are hurdles, and every time you handle an objection, you remove a hurdle and you make that sprint to the end easier for the customer."

So the goal isn't to win the argument, right? It's not about challenging someone and arguing backwards and forwards. The goal is to remove the argument. So when someone comes to the end of it, they have no negative thoughts, they have no confusing elements, and they have nothing in their mind that prevents them from taking the next step.

So remember, when it comes to objection handling, answer the real one, not the stated one, and choose your plan of attack. What is the best way to handle it? And you will remove objections. You will reduce customer concerns about the product, and you will increase the action that you want, whether it's click-throughs or purchases or whatever stage around your funnel or some guys.
So next up is module 21, which is writing ad copy and video scripts. I will see you there.

Transcript 21

David Briggs | 00:00
Property module 21 of the new and improved ECOMM Architects copyright course. We're talking about writing a copy, statics, and videos. The key thing, if you want to take anything away, is to mind the winners, break them down, and adapt the architecture.
So we are not copying other people's ads because their ads will be at different sophistication levels. What we are doing is just breaking down the frameworks of those ads, the architecture, and the bare bone structure, and then making it all wrong.
Okay, so that's the purpose of this video. So there are a bunch of tools I'd like to use that we'll get onto later, but for now, let's just get into it. So first of all, writing from scratch is fine if you're super experienced at it.
You know your frameworks, you know AA, you know past, you know Dash, you know SLAP, you know all your different copywriting frameworks. Then sometimes it makes sense to write them from scratch. If you already have a proven winner, let's say, for example, you had an AI ad that was performing really well, you might want to rewrite that same concept as a before-after bridge style ad, right?
So in that sense, it can make sense, but the reality is that lots of people stare at a blank page. It's like, "My god, it's going to take me years to write this ad. I'm overwhelmed. There are so many tools available now to rip ads, so you are not staring at a blank page." The reality is that there are some telltale signs that an ad is performing well, and one of the biggest and most obvious ones is the runtime. People tend not to leave ads running if they are on profit.
So if an ad is performing, if it's been live for over 15 days, or if you are seeing multiple variations of this similar ad, there is a very strong possibility that the ad is performing,
and that framework is working. So don't look at a blank page. This is where bad ads come from when you don't have years and years of experience. Every category, there are going to be some big brands, some small brands, some similar brands to your own. There are going to be brands in adjacent niches.
For example, I've been working with a swimming Google brand. There aren't many direct response swimming Google brands out there, so we looked to the ski and the cycling niches because they have a lot of parallels and similarities. What you are doing is you are leveraging somebody else's learning rather than you doing it yourself.
It's like mentorship. Why are mentors valuable? Because they cut your learning curve in half, right? When that TED speaks to you guys, he's had the wins and the losses. He's built from scratch, etc. What he is teaching you is things he did, right? The things he did wrong.
So you can navigate the minefield, right? You don't have to stop at every single mine and risk explosion ads to the same. If a brand has been spending a hundred thousand a day or maybe you know their account is astronomical, why would you not learn from their learning, right?
So that's what we're doing when we're ripping other as, so you don't have to invent. You're finding the architecture that's already winning. You're breaking it down beat by beat and you're rebuilding it for your product.
Okay, my favorite tools for doing this there are three that I like to use. There's Atria, which you'll be familiar with if you've spent any time on Amy's course or speaking to Amy. There is Get

Hooked. Get Hooked is similar to Atria, but it has some search features that make it, in my opinion, easier to navigate on keywords. They both have their pros and cons.
And there's the daily virals. Daily Virals is very specific to TikTok and it has some of the best AI analysis of any ad platform to. So when you click on AI analysis on the daily viral, it gives you a really detailed breakdown of why the ad is working and estimates the sophistication level.
So if you're trying to just improve your copywriting in general, that's a great place to go. The Daily Virals. Choose ads you like or ads that catch your attention. Do the AI analysis and see if the reason it stopped you is the reason that you thought it was, and start to think about what it is about that ad that is catching your attention.
Okay, so from David Ogavy, Confessions of an Advertising Man. On average, five times as many people read the headline as read the body copy. Right? So it's pretty obvious that if it's a video ad, it's your hook, right?
If it's your advertorial, it's your headline. People read that, and then they decide whether they're in the right place at the right time and they're the right person to be reading this. If you don't mail that, you're wasting your money.
So if you basically four times as much time... So the ratio is like four fifths to one fifth. Four fifths of your time should be spent above the fold. Because if that bit doesn't do the work it needs to do, then it's not going to work.
The same goes with hooks and leads. If your hooks and leads are weak, you will lose people, so invest your time proportionately to the impact it has on the overall piece. So static architecture. How do we break down static? So it's three things because Facebook we don't read things linearly from top to bottom. We go to different places on a page, right?
So with a static image, we have the visual hook so the image stops the scroll before the words actually do anything. Okay? That's the pattern interrupt. So there are some really good native statics right now where it's like a gross image of someone's foot or whatever, right? Depending on your brand and your niche, you can get a lot of attention with static image ads, particularly long-form copy on static image, as the next part that people are going to read is normally the headline, the headline promise.
So what are they going to get out of it? It needs to be specific and concrete, and you want to avoid anything that makes it sound super salesy because even if they subconsciously know it's an ad, which they probably do, they don't need it
thrown in their face. You are putting up a layer of friction if you make it come across as really adding. Then they want a reason to click. So proof mechanism, curiosity, something that drives a click to the funnel.
So that's your copy above it, what's going on in the image, a reason to explore further, something to ignite their curiosity. Okay. So the same principle applies. So where do winning hooks come from? They come from mining, right? The previous scripts are already public, find them, then take box works.
So atria, you can search there, get hooked, you can search their daily virus, you can search there. They all offer something very slightly different, but they're all there for the same reason to make navigating like Facebook ads, library, TikTok ads library, that kind of thing easier and more efficient. You can search by keywords, formats, industries, angles. You can go there with a purpose of what you're looking for and cut down on your research time looking for these different frameworks. You don't have to pick one.

I have multiple libraries. I've got a GitHub library going on. I've got different swipe files all over the place because I know where those swipe files are and which ones I need to go to depending on what I'm doing.
Okay, so even when I literally all I do from morning till night is consult people on copy and write copy, even though that's what I'm doing, I still use swipe files regularly. Because there are brands that have a whole team of copywriters.
Maybe they've got 20 people on staff. Big brands, and they're able to test ten avatars each week. It would be stupid to think that I can outperform them when they are getting the feedback and the data and I can use my skills to see what they're doing, and then I can use that to my advantage so I can build on their learning so it becomes a compounded effect.
So here we go. Here's a breakdown of an ad that was working really well. Took this one. Today is Monday, the 4th of May. The 4th be with you. I had to get that in there. This is the statistics from this app.
So according to attribution on daily virals and it's fairly accurate because TikTok is quite transparent about revenue and stuff. It's done about 442,000. It's had nearly 2 million views, over 3 million impressions, lots of likes, and loads of comments and engagement.
It is this green screen style ad with this. That's actually a guy in the front trying out this new product speaking to a highly sophisticated, solution-aware audience. But the product is the differentiator because it's a new way of doing something that other people are doing, and that new is important.
So this is the beats of it, right? So it's like, "This is a powder, right? So it's an eyebrow powder. It's new. Not a pen or pencil or anything. Adds a powder, and that opens the curiosity loop so people want to know why is this different, why is it better? This is cool.
It's new, so I'm already invested." Then it goes into the brand and the product reveal. This is this thing by this brand and it's really cool when you love it, that kind of stuff. Then social proof is going viral. These are the people that are using it. Jeffrey Starr used it, then a demo and a reaction.
So, I'm going to try it right now. My God, it looks so great. So you see a real-time payoff and then before and after, there and then a kind of urgency close because this is a kind of viral trending product they can push the urgency of this is new. This is cool. Everyone's going to be using it. You need to be
first. Okay, so that's the breakdown. Daily virals did this for me. I didn't have to figure this out. All this data was available on the platform. Okay, so same architecture and new products, right? So these are the beats as I just said, how do we switch that up? So if we're talking about a curiosity question... This is a power that I could become like this is for skin on the 30, right? So this is for skin under the 30. Then your brand reveal becomes that going viral because it could be sold out three times. The Jeffrey reference. Who was it? Jeffrey Starr? Jeffrey Starr reference could become like dermatologists, like this is the one that dermatologists actually use. Then it could be the micros stamping my show, the product working like, "My God, I can feel it like it's tingly." It could be about the sensation. It feels really nice, actually. After wheel was gonna hurt and then before after, like, "My God, this is like an hour after I did my treatment." Look like I can feel like I feel like it's my skin's more glowy, it's more dewy, whatever. Then an urgency. Clubs could be a stock or bundle that we've taken the same beats. We've adapted to our product and to what we know about our product and what our audience cares about.

Okay, so how does the body actually ship? So one body can have twelve openings, right? You can change depending on how long your ad is. Sometimes you just change the hook and you have multiple bodies. Sometimes you change the hook and the link, right?
But one build, one strong middle, and close. So that's the bit that can stay the same. The problem, it's solving, how it's different. The proof and then the CTA and then you can write a bunch of different hooks.
So you go back to the hook module and be like, "Right, I'm going to write a curiosity hook, a question hook, a controversy hook, all this kind of stuff." Then think to build particularly your first frame, which I call the triple-th hook. Your first frame. The thumbs stop.
So before the video plays the actual image, they see the text that's on the screen and then the audio. Because most feeds play on mute, so the caption there is what makes most people determine whether they're going to play the video loud or not.
So the visuals carry meaning that first frame thumbs stop is critical to get right. And realistically, your thumbs stop rate should be 90% or higher. So if you audit your ads and you're seeing a thumbs stop rate lower than 90% and you're losing some of your potential customers before they've even played the video just based on that first image, that's how important it is.
Okay, so how does it work? So if we take that Myx Nix architecture applied to a beauty device, right? So you're stamping this on your face? That's my curiosity hook, right? Like, "Where is this thing?" The camera could be a golden needle head. Same kind of curiosity question pattern then, like, "This is pure micro infusion. The at-home version of what your dermatologist does and is direct."
How simple was that? A way of explaining what it is? Because combined with the visuals, people go, "Yeah, I've seen a dermatologist do that." That's the micro-needling thing, right? And then proof, like, 24-carat gold needles is sold out three times.
Like 90,000 women are using this. I don't know how I didn't hear about it, right? Then the demo stamped the needle across the cheek. Or that's gentle. I thought, "Moment of time" because then you're alleviating a concern someone might have.
Then before and after like, "This is the bit I stamped. This is the bit I didn't like. Can you see the difference of the same light in visual proof?" Right? We have just transferred the same architecture, but we have made it about our product based on our research and based on what our customers care about.
Okay, so same skeleton, but we've rewired it to present our product in the way that we want to.
Okay, so that's a really basic beginning step for your copywriting. You've got all your research folders.
You know who you're talking to, you know what they care about. You know all of these things, right? It's like having all your clothes spread out on the floor, but not having a wardrobe to hang them in. Neat. You've got everything you need, but it's not organized. Using this kind of system helps to organize your thoughts because you can use... You can take one variable way. You can start with frameworks that are proven to work for other brands and adapt them to fit yours.
So this is a really good way of doing it. So fine, breakdown, adapt, test. Okay, so mine, the swipe library. These are investments, they are absolutely worth buying into. I have gotten hooked, I have atria, I have trend hunter, I have a whole bunch of these talks.

But atria hooks at daily virals I go to almost every single day because I like to see what's trending organically in niches that I might not be familiar with. As you can probably tell, I'm not a big skincare guy. Ironically, given the amount of skincare brands I work with.
But if I want to know what people are talking about and how their attitudes to skincare have changed, I need to find organic, honest, viral content from influencer people in this space that can help me do that.
So you can find three winners in your categories, right? Either in your niche or adjacent niches or niches where it makes sense, right? And realistically, you want to look for a minimum of 15 days, but really it should be 30 days up. The ad has been running.
If you're using Anthropic, make sure you have the filter on that says, "Active." Okay, because an ad that worked in 2022 and ran for a whole year till 2023 might have been a really good ad at the time.
But the chances are quite high that if you relaunched it now it wouldn't because trends have moved on and the market will have moved on. It might not be relevant. Okay, so mine and build a swipe library, then break each one down bit by bit.
So what is it literally? Line by line you can copy the transcript, what's each line doing? Why does it work? How am I going to adapt that? So you find the architecture that fits your product. So it's not about the one with the biggest views, it's about the one that makes the most sense. For example, if you're a problem-solution product where you're solving a very direct problem, you want to look for other problem-solution ads because their structure and framework will make the most sense to fit what you are selling. Then you can adapt it with AI for hook variations so you can give it all the information about your brand.
Say this is the ad that I want to base my new script on line for line. Let's mirror it but use our information, okay? Then you can... Cap does it and then gets that ready. Sorry.
Then you want to do the caption pass and then ship it. So read it on mute. Does that first frame actually grab your attention? A lot of the time people put the text on as an afterthought, and there are probably millions of dollars in sales that get lost every single day because people just don't watch the ad because that thumb stopped text this week.
So figure it out, okay? AI is really good for variations. That's where it's king, right? So if you've got an idea for a concept or controversy, hook, I'm going to question what people have been doing. You've been doing this for the longest time or whatever, but I can't find the right words. You can tell it that and get it to give you the right words, right?
It's great for things like that. He did the sip of my tea. So how do you put all this together? So mine breakdown and adapt and ship, so pull free winning ads time-stamped the beats on each one. If the tool doesn't do it directly...
I think actually they have timestamps already. I think they all do actually. But then start figuring out what each section is doing and don't just plug it straight into AI because if you want to become an expert copywriter and really leverage the skill to your advantage, you need to know why each line is doing what it's doing. You could run it through AI off that, like a teacher marking your test and saying, "Was I right or was I wrong?"
What do you agree with? What don't you agree with? That's a good part of the learning process, but it needs to be something you can do, and the more you do it, the faster and better you get at it until you can go, "All right, so this is this sophistication, it's this awareness level, it's using this

type of hook, it's got this type of body, there's the unique mechanism, there's the clothes. I get it. I can do this."
So pick the architecture that fits your product, write your adapted script. I like to start with 30 to 45-second scripts just to get my ideas out there because that will give you a good core concept. If you want to develop it, you just take each of those sections and you build them out individually. So you add more information to your mechanism section, you add more information to your problem section, and then generate five alternative three second hooks for the same body. Okay, three to five hooks is the sweet spot. Hooks do massively impact performance, so never run an ad with just one hook and then go... It doesn't work. Chances are it could just be a weak hook, and if people had actually watched the ad, they'd go much further.
So what's the takeaway? Mind the winners. Take the architecture, build it for your products. Okay? Use their foundations, use their learning to your advantage, but make sure the ad is not just a rip-off of theirs.
It is just the framework, just the skeleton. But it is relevant, targeted, and based on the research that you have done for your customers in your niche. Next up, we're looking at advertorials or bridge pages, as you often hear me call them. Why they're good, why you'd want them, and why you need them. All that kind of stuff. They're absolutely my favorite thing in the world to write. So we're going to cover that next. It's a good one. See there?

Transcript 23

David Briggs | 00:00
23 of the UA copyright course. Today we're talking about VSLS and to kind of put it in its simplest terms, video sales Letter is an advertorial in video format. It does much of the same thing. It's got the same DNA.
It's just.
Hey, guys. We are now at module 23. And this is the V SL writing module. So what's a VSL? Video sales letter? Is a advertorial in video format. Basically, it kind of has the same DNA, has the same beats, but instead of people reading it, they're watching it.
So let's jump into today's module and get into it. So similarly to an avertorial in module twenty two, it's kind of doing the same thing, but it's a different delivery system. So it's good for warming up cold traffic.
It's great for top of funnels. It can pre sell the offer, can filter out audiences. But instead of a reader, you've now got a viewer, and what wasn't an article or an advertorial becomes a script and the reading time becomes the runtime.
So it has the same architecture, does the same jobs, but there are different kind of production rules. Okay. Just like if you're doing a long form static ad to a videoscript, it's the same principle. And what's important to remember with any kind of copy you're producing as well as it is not written. So when we build and I use that word specifically for a reason, we build copy. We don't necessarily write it. Copy is made up of blocks. Each block is has a purpose to progress the sale, to educate the audience to move them closer towards a buying decision.
So the headline to leave the body to close. All of these pieces are there to progress someone towards the next piece, and then together they carry the sail. And that's ultimately what we're trying to do. Our focus in direct response and in copywriting is to get sales.
So what are the ten beats? These are the ten beats that I like to you. So if I'm writing out a V SL or an advertorial for that matter, I kind of focus on these kind of ten blocks. These are my kind of ten non negotiable sections. There are many different ways to write VSLS, but this has been one I've system that I've been using for years. It consistently delivers results, and it does that across a whole range of different niches health, wellness, supplementation, pain relief, lots of different issues this is appropriate for.
So how does it work? So first of all, has a hook. Obviously, that's the grabbing the attention pot. We want to capture their attention and draw them into the story that we're telling. Okay? After the hook where we identify our audience, ideally we want to highlight their problem.
So name the thing that's rocked the visible symptoms that they recognize what is their lived experience, identify it, call it out, make it real for them, and then you want to agitate it. So there's two forms of agitation that work really effectively. The first form of agitation is the cost of leaving it alone.
So what happens if you don't address this problem? So what starts out as a couple of, you know, bad nights of sleep? Or maybe you've noticed you haven't been sleeping that well for a couple of weeks. What happens if you don't fix that?
Well, the consequences can be way more severe than people quite of realize. It can cause problems in relationships. It can cause arguments with kids. It causes poor choices when it

comes to the diet. Less self discipline and higher levels of anxiety, higher stress on heart. There are a whole range of issues that come from a lack of sleep, for example.
So when we agitate it, that's what we're doing. We're helping them realize that this isn't something to brush under the ruck. This is something that you need to address because the consequences can get worse. It can be severe after you've agitated it. You want to highlight what the real problem is.
So you. You know, maybe you've already tried some sleep supplements, or maybe you know, you've been listening to music, white noise, you've got cold, dark room, but nothing seems to be helping. Or here's what's really going on. Reframe it. Make them think about what the root cause is.
So sometimes it's called the unique mechanism of the problem, sometimes it's called the root cause, but however you want to kind of name it, that's what it is. What's the realization? What do they think is the issue and what is the real issue? We need to take them from there to there in the real problem section. Once they understand the real issue, you can introduce the real solution, right?
It's that simple. If I know that no matter how much running I'm doing, I'm not losing weight, and someone says to me that's because you're not doing resistance training, then the solution would be to do some resistance training, right? That makes perfect sense.
And then you introduced the mechanism. So now they understand what their real problem is. They understand what the real solution is. You introduce the mechanism. So how do they achieve the real solution? What is it that they need to do that is different to other things that they've tried? The mechanism is the vehicle for the solution and the product is the delivery system.
So after they understand the mechanism, then you introduce the product. It's the answer. The product solves the real problem using the real solution via the mechanism, and you can kind of see how all these dots connect.
It's very logical, and that's what we want to do. We're not asking our audience to guess. We're not asking the viewer to figure things out for themselves. We are spelling it out for them. And once you've introduced the product, you want to validate it with proof so you know. Stack the receipts. Show social proof. Show expert testimonial numbers, names, demonstrations. Show them that the thing works for people who are exactly like them.
It's the mirror effect. Customers want to see themselves in the person that have the problem, kind of emotionally, but physically. That person looks like me. That person has the same problems as me.
It's working for them, so it will work for me. Okay, so your choice of who is in your video ad is very important as well. And then you want to handle any objection so you can preempt those silent arguments.
So maybe it's a price thing. You can trivialize the price. You can say, look, what's the cost of not doing anything? Or how many? How much money have you wasted? You've probably bought a new mattress by now, thinking that'll sleep you. Fix issues, sleep, fix your sleep issues.
And then you want to go to the club where you introduce the offer, the urgency in the CTA and you open the door for them for the next step. So it doesn't matter whether your VS CL is long or sure. So I mean a VS. CL, in my opinion can be anything kind of over three minutes.

It's kind of what I would define as a ESL I think a lot of people just think any as kind of over a minute as a ESL it's kind of semantics. It doesn't really matter. But typically, like there are e commerce brands using BSLS that are six minutes long, 7 minutes long, ten minutes long, and then when it's really like high ticket stuff or high tick, high AV offers, then they can be much longer. Lots of the like CLICKBANK kind of physical product affiliate offers have very long VSLS, and when I say long, I don't mean that they're just padding them out. What they do is they take those ten beats and they expand on each of those sections.
So instead of spending 30 seconds on the problem, you will go much deeper into it. And you might spend two minutes on that problem up to kind of 5min on just on the problem section. So same beats, but greater depth is kind of the thing I'm saying here. The longer the V SLAs well, the more open loops you will need because you need to keep engaging and re engaging. Pay something off, introduce something else to think about. Pay something off and introduce something else to think about.
It's why long form advertorials and VSLS are the highest level skill in copywriting. They are the hardest thing to do because to maintain attention through a long kind of video requires a lot of skill.
So it's definitely something everyone can do, but build up to it. I wouldn't start with a 10min for your CL I'd start by let's take my win on my 45 s to a minute and half long script. And can I expand that? Can I just go deeper on each of the points that are working because I've proven the script works, I can see the metrics for it, and can I just go deeper into those and build it up over time and you will see that it is doable. You want to be opening fresh loops, constantly keeping them engaged, give them reason to stay and watch. The other thing you need to talk about, and this comes from the show don't tell module, which was module 17, is you want to dimensionalize it.
And dimensionalization is a very fancy word for show don't tell. So an example of poor dimensionalization would be something like. It reduces inflammation in the gut. There's nothing about that makes me feel that that's relevant to me. I don't feel that. I look at that and as an observer, someone from outside looking in. Whereas when it's dimensionalized by Tuesday morning, the blowat across your stomach is gone. The waistband on your gene sits where it used to. That I can see myself in. That makes me think about my life and the context of who I am.
So it is like holding up the mirror to your audience. And that's what really good dimensionalization does. It holds up the mirror so they can see themselves. So let's take a kind of example of what a V SL might look like.
Okay. So you'll see that there's dimensionalization in this. We've got specific times and specific scenes, and the whole point of this is that the viewer is recognizing themselves in it. So the hook if you wake up and your stomach feels tired before you've eaten a single thing, you're not alone.
And it's not just bloating, it's a signal that something deeper is going on inside you, and the longer you ignore it, the worse it's going to get. So it's kind of a shock, worry kind of hook, right? Like if this feels like this and you can you've experienced this, you need to listen to this.
And then. And then the problem you eat lunch and an hour later your genes feel a size tighter. You crash at three in the afternoon, your skin breaks out for no reason. You wake up at four in the morning, stare at the ceiling, you cut out bread, day, wine. Nothing's changed. Very

relatable for people that have this problem. They'll recognize themselves in that feeling of kind of struggling by kind of mid afternoon of the random breakouts, particularly as you get older, you know, like, come on. I'm in my like, you know, 30 s forties, fifties. I shouldn't be dealing with breakouts anymore, but the skin has, you know, it's the biggest organ in the body. It responds to inflammation in the agitate section. Five years from now, the same genes don't fit. The fatigue you call just being busy is a daily TA your doctor keeps running the same tests and saying everything's normal, and you know it's not. You feel it every day and again. This is relatable many times. People, because they know their bodies, they're able to detect things that don't feel right in themselves.

Before the markers are, you know, alarming. You know, it's quite hard sometimes to get a doctor to take you seriously. So again, that's very relatable, recognizable. I know I'm not right. So like an example from my own life.

I know I'm about a stone overweight, b because I'm 6ft one and fairly broad. Looking at me, you wouldn't say. Yeah, he's a bit overweight, right? Because I kind of carry it well, but in my body, I know that that's not optimal for me, so I feel off.

So it's personal to me. And if I say that to other people. I know you look fine. But for me, it matters. And that's what this is. Is like, you know something's not right, and that's what makes it relatable.

So let's move on. So what's the real problem? The real problem is here's what your doctor isn't telling you is the reveal right? The reason you feel this way isn't your diet, isn't stress, it isn't your age.

So we've ruled out the three most common kind of things that they'll be told. It's chronic low grade inflammation in your gut. Lin, your gut wall is supposed to be a TED seal. Microscopic gaps form in the lining. Particles that should never go into your bloodstream start leaking through your immune system reacts.

That's when your skin breaks out. That's when you're tired. That's where nothing fits the same.

So now we've got a new understanding of what's really going on. We've given the problem. We've taken away their previous misconceptions, things like diet, age and this and said, well, actually, it's this. Here's what's really going on.

And when they understand that, they say, okay, I get that makes a lot of sense, that that's what I'm experiencing. I've tried all the other stuff. None of it works. So all of these things are making sense.

It's logical is adding up and then you introduce the solution. So what actually fixes this? Not another fiber powder, not another cleanse, no more cutting out food groups. What works is two things working at the same time. You need to calm the INF that's already there.

Kind of phase one and then seal the gaps in the lining so new particles stop. You can through phase two, do one without the other when you're back where you started in three weeks. So what we're saying is the solution is twofold. Has two parts. Calm the damage that's been caused, fix the root cause issue so it can't happen again.

So this is the bridge, right? If we were talking about an advertorial, this would be the bridge section where we're bridging from where they were in their thinking to where we want them to be in their thinking.

So the mechanism. So two compounds do exactly that. The first is a clinically standardized extract of a root used in a Herdovic medicine for 2000 years. So we're giving it some credibility

by showing that it has heritage. It copes theflamed tissue and shuts down the inflammatory signals at a cellular level.
That's what it does. The second is a precise precision dose of a structural amino acid your body uses to rebuild the T junctions between your cell walls. One sues, the other rebuilds. That's the solution. Now you understand the problem. This is the solution you need. Together they break the loop your body has been stuck in for years. Now we can introduce the product because they understand what's really going on, how they can fix it.
And now we show them that the product is the thing that can deliver that fixed form. That's exactly why we built Restore Daily to deliver one capsule, both compounds standardized dose, the party tested, manufactured FDA registered facility. You take one capsule with breakfast, that's it. No new git, no cleanse, no twelve step protocol you'll abandoned by Tuesday that is doing a lot of heavy lifting in there.
It's great, it shows it's simple. One capsule with breakfast, how easy is that to do? Anyone can do that. It's third party tested. It's manufactured in FDA facility. So I'm already believing that it's safe and approved. I'm not having to change my diet, I'm not having to go on a cleanse, I'm not having to commit to a complex protocol. This is ticking all my boxes.
And then the proof objection and close. Okay, so the proof is Sarah's 47 cut out gluten, dairy and alcohol, and she was still gloated every morning. 21 days on restored gut, the bloat was gone, two waistband sizes down by week six. Our clinical study showed that 41% drop in inflammation Mark has been six weeks. Very credible. We've got a relatable scenario. You want to be like Sarah?
If I'm in the position she was back then. Bloated, sore, uncomfortable, giving up things she likes. I want to be where she is now. And then the 41% is adding additional credibility. The objection. You're probably thinking, I've tried supplements, they didn't work well, most don't, most are under dosed. RESTOREGOT uses patented forms at a dose used in clinical research. The exact one.
And if it doesn't work, send back the empty bottle we refund you. So there's a risk reversal and an explanation as to why this works when others don't. It's clinically dosed and based on clinical research.
And then the close. Right now we're bundling a three month supply. 20% off three months is the minimum window that research shows is needed. How do I increase my AV of a product? I show a realistic time frame window. Most supplements require time to build up in the system. Most skincare products require weeks or months of use before they actually start to take effect. It's the same principles when you're at the gym. Frequency and consistency matters far more than extreme bouts of individual effort. Two weeks from now, you'll know. So what are we doing here? There's belief, sequencing and loop chaining going on.
So the architecture is visible. The two things that hold it together are not so you can see the architecture what we do in here so each beat shifts one belief. So like my diet is the problem becomes it's in my gut lining. We're moving them along, right? Beat by beat. The viewer arrived at a conclusion the script wanted them to reach. We are guiding them to the conclusion that we have predetermined they are going to arrive at. We know what their destination is. They don't. So it's our job to get them from where they are to the destination we want them to be at. So when you look at it, you open a loop in beat 2, you close it in beat 4, you open a new loop in beat 4, you close it in beat seven, you get. You are controlling the narrative to get them through

the story, so the viewer really never gets a clean exit point, and that means all of their questions are answered until the close.
Okay, so that's the kind of goes back to module 16 in longer for we are in control. And when we open loops, we increase their engagement. We get them to stay and watch. We close a loop, we open a new loop, and by doing that, we are pulling them through the copy, making sure they kind of weave and zig and zag exactly where we want them to, which is the purpose of it.
So how do you build it for yourself? Outline only 10 beats, right? Ten beats, boom. Just put them on a page, put them on a Google Doc or whatever, and then start to kind of structure outline around that, and then you kind of draft your opening.
So if you're going for a ten minute VSL, you might want to draw a two minute opening. You don't need to start with a ten minute VSO or to start with the full five minute VSL make it 30 seconds or something, right? Think about the hook problem. Agitate kind of part of it.
So, as always, the top. The front. The above. The fold. The first part of the video, the top of the adversarial. It's the most important part. Because if they're not getting past that, the rest becomes irrelevant.
If they're not watching past 30 seconds to a minute to two minutes, nothing else matters. So that needs to be really dialed in. Then you want to move on to what in the mechanism, the product intro. So that's kind of your like load bearing wallway. It has to be different, new, exciting, interesting, hopeful, but believable. Don't tell someone they're going to lose seven pounds in seven days or something absurd like that. Believability will go far further than absolutely outrageous claims.
And then you want to dimensionalize all the claims you're making. So go through the script, if there's anything abstract in it, contextualize it, dimensionalize it, put it into a scene. What does that mean for the person? What are they actually experiencing? Does it get a name and number? No exceptions? You want to dimensionalize as much of your script as you possibly can and then read it aloud. I still read my copy out loud, and I do that because sometimes something written looks great in written form.
Say out loud. It becomes clumsy. You're kind of tripping over your tongue and you can't get the words outright. If it kind of feels awkward or it's hard to follow, or you've got sentences that are too long, just rewrite that section. Doesn't mean you want to start from scratch. You just work on that section.
So kind of good thing to do for you guys is if you can outl all ten beats for your product, right? You've got all the information. That's why we do all the research. First. Aim for like a runtime of like, you know, it doesn't have to be eight to ten minutes.
That's kind of quite high. And for something like 4 minutes. Okay, and draft it. Okay, so typically you want to frame it out so you got like 150 words. 150 words. 150 words. That will kind of get you on track.
Okay. And then mark everything that's abstract, fix anything that's abstract, dimensionalize it, figure out some open loops. So where's where have you opened the loop? Where have you kind of planted a seed, and then where have you paid off?
And then read it out loud when you do this regularly. And I do suggest that if you care about your performance in your business, that you do learn copyright in really effectively, it starts to become kind of automatic. Now, if you're looking for. Or examples or whatever, they're really easy to find.

It's my wrap up here. So yeah, a VSO has the same architecture at different runtime. Okay, so instead of every line releaf onto next line, it's every minute and the next one. So what I suggest if you're looking for the SL examples is you go into Atria, which I have open here and you go to format video length 1 minute, 20 seconds plus and you will see some brands that run VSLS. So, for example, we've got Miami M really famous skincare brand that run a lot of kind of longer form ads. This one's forming. It's eleven. A lot of the pain relief niches run longer as one there for, hair regrowth during the menopause, that kind of thing. You'll see that some of these ones lead to VSLS as well, so. Michael Todd Beauty I know someone that works there. You'll see some of them that lead to VS cells that someone needs to take away his camera.
So here we've got a light. Try it. I'll read that one. Let's just pick one at random. Let's try that one down more. And here we have a long form advertorial. So we've got a V SL long form advertorial and an offer.
So you'll see that often when there are longer video ads running, they will have links to either VSLS or long form content. I have some I've saved. So there's a couple of brands here that I can share with you that do VSLS.
I think if it will let me swell down that is let me gosl so testo green max for example so test a green. Macs are one that you can study if you want to, but click to play button. Five surprising foods that get that can plummet chests or spike each stream guys over 50 so highly targeted important make sure it sounds on alright.
So this had a law format that then went to this VSL so this one I but it's pretty long.

Speaker 2 | 25:49

If you're a guy over 50, you need to be.

David Briggs | 25:54

So yeah, backdrops it off for VSLS. My kind of big takeaways from this module are VSLS are pretty much Albertorials in print, they need to open loops, you need to keep engagement high take.
If you want to experiment with VSLS, take your winning short form ads. Develop it into a VSL using those ten beats and structuring your ad around that. And when you're analyzing videos, when you're looking into videos, you'll start to see that you're seeing those beats in lots of kind of long form as because they work.
It's a logical argument. Progresses someone sensibly. From where they are to where they need to be. And it ttextualizes it in terms of their life. Okay, so that is me done with that one. I hope you enjoyed it.
And I will see you in Module twenty four, where I'm going to very briefly touch on e mail copywriting. But purely from a copywriting perspective, I want to make it super clear that Josh is the go to guy for email.
But I will give you my take on it as a full final copyrer. It makes sense that I do that. So thanks very much and I'll see you in the next one.

Transcript 24

David Briggs | 00:00
You guys are welcome to module 24, which is emails, free commerce. Email is such a powerful tool. At one point when I started my career, I used to get a 40 between a 35 and a 45% return on your email.
So for every one dollar spent, you could expect to get somewhere between $30 and $45 out. It's slightly lower now, I believe, but I'm just going to give you my take on email copywriting, from a copywriting and strategy perspective. I want to make it super clear that even though I love writing emails, for certain brands, I hate it for other brands. Even though I do enjoy writing emails, we've got phenomenal people inside Econ architects that specialize in this day in and day out.
So Josh Chin inside EA, he's the expert on email strategy like Life Cycle Architecture, Segmentation, Deliverability, Flow design, Attention, Modeling. So if you want to get really in-depth about your email, which I suggest everyone does because it is such an important part of your retention system, Josh is the man for that.
So as a full-funnel copywriter, what I mean by that is someone who, when I work alongside businesses, I help them with ads, advertorials, PDP copy, basically everything they need. I felt that I should cover this.
So that's what this is about. Gary Halbert in the Boren Letters, which are a great read, says that every piece of mail you're prospecting in your prospect's box falls into two piles: a pile is personal, and they open it. The other pile is everything else. Your job is to write a pile.
All right, so you want to write stuff that people want to open, that they want to engage with. I know a lot of brands sell emails because they feel like they have to. Actually, with some of the brands I've worked with on email, sometimes less is more, and sometimes more is more.
So you really have to go in-depth and assess what people are responding to and what they care about. How can you add value through email? How can you keep them personal? How can you make sure that they feel seen, represented, and not just like another number on a list?
So in essence, every email has three jobs to do. So you've got the subject line and the preview line, which is essentially your hook. You've got the body, as in the thing they actually read in the text, and then the CTA, so just like with a hook or headline, if the subject line isn't good, if it isn't relevant, if it's interesting, if it is engaging, you're never going to open it.
The whole point of the email's lost. So if your open rates aren't where they should be, then it's a subject and preview line issue that you really need to look into. Now the body. So when they do open it...
If we're talking about designed emails, you want to have a hero image with text on the hero image. You want to have a CTA button high up on the page. It needs to be conversational and scannable. Most people are flicking through their inboxes. They're not paying a lot of attention. It needs to be engaging, it needs to be something they want to... Then the CTA is the door. So it's one ask, one link, one reason to click. Emails are short-form content. You can write long emails, but typically even a long email in the grand scheme of content that people consume, it's fairly short.
So you don't want to make it very complicated, just like you don't want multiple CTAs on your product description pages because it gets confusing for people. You just want one ask in your

email. So the hook is the hook in an email, as I just said, is your subject and preview line. Be-pile hooks look like this. They're the ones that Claude, ChatGPT, or whatever typically churn out, right? Our spring sales hit.
So what? I've got 50 other emails in my inbox that say the exact same thing. It looks like an ad. It's treated like an ad. If it feels like I'm only here in Rembox to extract cash from you, then it turns people off. They don't want to know that a pile... There are a whole bunch of strategies, but really, the email should feel like it's coming from a friend, right?
I think nobody told me about my skin. I wish I knew this sooner. I forgot to send this last week, that knee question you asked. We're doing things that engage them, right? We want them to feel like it's a letter from a friend.
So the principle of what makes a good hook is the principles of what make good subject lines. You want to do things like optimize character count. Josh can go into way more detail about that sort of thing.
But you want them to be short and punchy and scannable and digestible. I think the average e-commerce email subject line is under 30 characters. They're really short. So you've got to say a lot in a very short space to get them to commit to that open.
Then you want to write like you'd write to a friend, right? So it's one idea per email. Don't try and say three things all at once, right? Three things, three emails, right? If you think they all need to be said, break them down and send more emails. Pick one and then pay it off. Make sure the first line is earning the second line.
So module 15 again, right? The first line is the hook after the open, so every line is hooking them into the next line. You want short paragraphs with loss of white space. Typically, e-commerce emails are very brief on text. Different brands have different rules about this. Some brands send longer-form emails, but you want to use whitespace effectively. They need to be aesthetic. They want to look nice in the impulse.
Remember, the compression on a mobile makes everything long and thin and skinny. So what looks like just a short paragraph of text on a desktop becomes a big brick wall of text on a mobile.
So think about white space walls of text scare readers. It's like, "I don't want to commit to this." So keep it brief. My kind of role is... I like to keep things choppy. So I like to have a short line and then a mid-length line, then maybe a long line, then another short one.
So I'm breaking up the visual pattern that the person's seeing as well. This is critical for our tour groups. So plain text emails are absolute superstars. I adore writing plain text emails. My absolute favorite thing in the world when it comes to email.
Typically, emails from founders perform really well where they're sharing a story or explaining why they made certain choices because trust outranks polish. People are quite happy to digest content that's ugly.
Organic TikTok, for example, if you think about how many hours a day some people spend on TikTok looking at stuff that's literally just been filmed like that on an iPhone or whatever, it's because it's high trust. It doesn't feel like they're trying to push any opinion or sell an opinion; they're just sharing what they think, and you can like it or not like it. The same goes with a plain text email.
It's the same principle. So really, it's like sharing something a quote. I mean, with Founders emails, it can be a book you read last week and what the takeaway from that was and how it

relates to your business and why the customer should care. It could be an inspiration for you, though. Hey, by the way, guys, we're putting on this sale, and I just want to tell you why we're doing it. There are so many ways to approach plain text emails, but they typically outperform design emails from all the important metrics.
So retention is a lot about identity. So you want to sell who they are, not what you make. You want to focus on them, not the thing that you're selling. So if we look back at the men's skincare brand that I worked with, I could have said something like "20 of our best-selling moisturizers this weekend." Don't...
Right? It would have been fine. Some people would have opened it and bought it, "Hey, I want to moisturize it." But if we speak to their identity, it becomes, "Most men over 40 stopped caring about their skin." You didn't... We're reminding them because we know they've bought from us. They're on our email list and in the segment. We're reminding them that they took an action to better themselves in some way. They cared about their appearance.
So we're reminding them. We're selling them the self-image, giving them a reason to stay subscribed. But to stay subscribed... When you get people to identify that way and commit to it, then they're not relying on the sales because they're not doing it for that. They're doing it because it's something they want to commit to, and they're doing it for themselves.
So identity emails are so powerful. They don't really improve the frequency, attention, or lifetime value of your customers. They encourage people to buy year-round, not just when there's a sale. The trap that a lot of brands fall into is that they run constant sales: summer sale, autumn sale, for sale, this sale, that sale. They train... You're training your customers to wait for a sale. Why would I ever buy anything at full price?
I know if I wait two weeks, you're going to have some other sale, and I'm going to get some massive discount. So if you speak to their identity, you don't train your customers to be reliant on that sales cycle.
So the brand that I worked with, we generate over half a million in monthly revenue, went up 97% within that month, and the discount didn't change. We stopped sending promotional emails and essentially started speaking to people's identities. We segmented more effectively.
So we had a first-time bias segment. We had the diehard customer segment, we had the in-between segment, and we started talking about not quitting on yourself. You've committed to doing this thing for yourself.
It's just like going to the gym. Men are not good at self-care, typically. I know I'm not. Or I will martyr myself into the ground when really I should be prioritizing my self-care because when I'm at my best, the people around me get the best of me.
So getting that message through resonated with this audience of men that we were targeting, and the results spoke for themselves. So, if you're doing an email sequence, like five emails, one arc, you want to pick a customer cohort and write a sequence to them.
Email one is welcome. It's an identity statement. Who? This list is for 1cta right, it's you're in the right place, we're like you, we care about you, we understand what you're going through, you're confirming and reaffirming their identity. Email two might be something like an education email explaining the mechanism behind your product.
So you are differentiating yourself on a deeper level. You've now bought this. Here's why it was a good choice. This is what it does differently. This is how much you know. Time and effort and research we've put into creating something that is right for you. Email three you might want to

do a social proof story, might be a customer story. His dad. He's seventy years old. He used to work in a coal mine or whatever. He's never once thought about putting a product on his skin until one day his daughter bought this. Make it real.
It's okay as a man to look after yourself. It's a good thing you should be doing there. Okay, so with an older male audience, they need that kind of messaging, and that's what worked for us. Then objection handling.
So you can start to handle possible objections they might have in their minds. I was committed to it at the time, but it's quite expensive. Here's why our products are premium, we use these ingredients, they're sourced from these places. Nothing is low grade. Everything is quality, even the pump design of our bottle is made to be easy to use, easy to remember, easy on the go. It's got a fast absorption formula, whatever it is. Preempt those and then put an offer on the table. You've bought this thing. There are other great things in our range that will complement that really well. Think about bundles or urgency or...
Then build a CTA in. Okay, you've got a list that are now going to keep converting. So this varies across all your core flows: abandoned cart, abandoned browse, abandoned checkout, welcome flow, pop-up flow. There are so many flows you can have in place. Some brands I work with have twenty different flows, others have five or six. They've got the core flows and they're still growing.
Then your campaign emails are on top of that. So your flows and automations are one kind of muscle, and then your campaigns are another, and they function differently. But if you want to go into real depth about email, Josh Schuman... In some of his work, he is absolutely phenomenal if you're looking for email inspiration.
I'd like to share my resources with you guys. I'll just show you your website that I think it's really good for this. Yeah, the takeaways just write a pile, sell who they are. Okay, let your handle the rest.
So one website I really like for email inspiration is called Milded. You can go to mil.com, but hopefully you can see here. There we go. It's just hopefully logging me in. Thankfully, I'm not a malicious bot, so we'll see. Claude, anybody there? Yes, I will verify that I'm human. There we go. Soonmil.com, you can search brands or keywords or whatever, right?
You can look at what they're doing, what their designs look like, and then if you go into you, you can click around. So, one of the brands I've worked with for a long time is the Bed Struggle, for example, and it's a men's beard care brand, and you'll see here that their aesthetic is Viking-designed here.
We've got product-focused ones, a new scent drop. We've got a sale one here. But you'll notice there are a lot of plain text emails in here. What we found was that there is a large portion of the audience that loves receiving the plain text emails, they love the storytelling, they love the reasoning behind things, they love the sincerity of them, and they perform very well.
Sometimes, they're not even a sale at all. It's just, "Get in touch, let us know what you'd like to see us do next." That kind of stuff. So this is a great resource for looking at various brands, seeing what they're doing. There are other ones. There are things like MailChimp that give you a breakdown of what flows brands are running.
But you can follow your favorite brands or brands who are in adjacent niches to you. See what they're doing and see how you can borrow, beg, and steal ideas from them.

So, yeah, absolutely worth checking out. That is my wrap-up on that. So for email, Josh is your man. But I hope you got some value from this. The next module we'll be looking at is landing pages and sales pages. See you on the other side.

Transcript 25

David Briggs | 00:00
Hello, and welcome to module 25 of Equal Markets' copyright course. We're talking about landing pages and sales pages. These words are used so interchangeably that just to be super clear, when I talk about landing pages in this regard and sales pages in this regard, I'm not talking about advertorials or PDPs. A kind of sales page is one that does both.
It's normally the bottom of a funnel. So for example, you might have an ad specifically talking about joint health, then an aditorial that continues that conversation, and in a sales page that makes the purchase possible.
So that's what we're focused on today. There's a brand that I really like, and I'm sure most of you will be familiar with. I'm going to use as the example here, but let's get into it. So first time...
So before we start, pages live or die on conversions. We are business people. We are here to make money. That's really important. So it's not the only metric that matters, but it is by far the most important. We are here to generate sales. We are businesses.
A little bit of housekeeping. First, OSH and OSH's agency are the absolute elite level guys on CO. So conversion rate optimization, once you've got your sales pages live and once you've got those pages built out, heat maps, A/B testing, layout tuning, and mobile optimization. Check out Friction as he is your guy for optimizing all of those things.
Having worked at build Gros Scale, a really good optimization company, and worked alongside some of the best CRO optimizers in the world in my opinion, I have seen firsthand how much of a difference really good CRO can make.
So if you have a page that's performing well but you think it can be improved, absolutely go down the conversion optimization route because it is so valuable. So this covers what a sales page is, what it is, and what you need to do. The architecture, the words, that kind of stuff.
That's the purpose of today's module. So landing page, sales page, PDP, right? They do different jobs. So as I said before, there's a lot of confusion about what a landing page means. Landing pages can be middle-of-funnel things where they're more focused on content and then they click through to a PDP. It can be a free quiz, a low-ticket offer, like a trip wire product before there's an upsell opportunity. The purpose of a landing page is really to warm up traffic, and they can take many different forms. A sales page is for people who are product-aware or highly aware. They're ready to make a purchase, but they need a little bit more convincing to push them over the edge.
PDPs are your basic Shopify description pages. So if it's search traffic and they come to your store, what's the information about the product? How does it help them? That kind of stuff. So they're different jobs, different readers. They do vary in word count, but that is very flexible. Some are huge pages, some are small pages. It depends on the product, the price point, and many other factors.
So there is no hard and fast rule for what's right and what's wrong in terms of length. It annoys people when I say this, but it's actually the truth. It's as long as it needs to be, so there is no routine for it. Hi, yeah, everything okay?
It's not a big deal.
Yes.

Good idea. Yeah, is that the one in the spare, the small bathroom? Yeah. I think part of that might just be a function of the toilet because it's a macerator. So the tube that actually connects to it is very small.
Yeah, well, my intention is tomorrow is to go over to the flat in the morning first thing. Right. And meet my dad there so he can pick up the tools and stuff that are his and we can start emptying it out.
Right? But obviously I need to swap the plans over because I can't fit anything in my car, right? With regard to the... With regard to the big stuff, I think you can just ask the council to collect it. You can just book a thing with the council where they'll take away big stuff for you and we just pay for it. What was...? No, I don't...
Yeah, well, the Soulfa does need to go, doesn't it? And the garden stuff, like there's no plastic top thing. I don't know how I would move that without emptying it all out. It is literally alive.
Yeah, just you'll ask, and if not, we'll figure something else out. We can just tape it shut and wrap it up or something. It's not the end of the world. It can be done. But... I mean... Yeah, well, it's just... It becomes a half-day job, doesn't it?
Yeah, okay.
Yeah, no, I agree. There's no point in waiting on that. Yeah. What I'll have to do is make sure I've put $700 in to the DB property account to cover the mortgage, because we're going to have to cover this first one.
Yeah, that's fine. On AU. Yeah.
I have a good day. SPIR but...
So yeah, different pages, different functions. Okay, so what is a kind of sales page? What? A sales page is a blend of an advertorial and a PDP so it has your product information, but it has additional information a typical classic PDP won't have.
So it covers both those bases in that regard. So the top half has advertorial DNA, so it might have a more hooky style headline rather than just the name of the product. It'll have comparison education and why this category?
Because we've reframed already why this category of solution actually works. So the reader learns something or they have a belief that they've established through the rest of your funnel reaffirmed so they know they're in the right place, they're getting what they want, that kind of thing.
Then the bottom half closes the offer. So the first half sets it up. The bottom half closes it. So it's got the ingredients, dosage, pricing, tiers, reviews, FAQs, guarantees, all of that stuff that's value stacking, risk reversal, social proof, all of these kinds of things.
That's the things they need in order to engage the logical side of their brain to make the conversion seem like a really good choice. So in good times, people want ad times, in bad times they have to... Whatever the climate, the principles of persuasion don't change, only the urgency does.
That's when Claude Hopkins, Scientific Advertising. So if you break that down, it's like a lot of brands, not e-commerce brands. We're pretty good at being really forward and switched on without our advertising.
But a lot of courses and things like this, they only advertise when they feel like they need it. And that's not the way to do it. You need to be advertising effectively and aggressively year-round. But the underpinning principles of what makes it work, the persuasion principles, everything

we've covered in the modules up to this point, that stays the same. It has been the same for decades, centuries. The psychological principles of what make people want to purchase things, own things. That life force aid kind of backbone.
It's always been there. It's always going to be there. So whatever your goal is, make sure you refer back to those direct response principles. So the architecture of a typical sales page can go like this.
So like Hero and Hook and CTA, you typically want to have a CTA high up the page above the fold. So people who have already made the buying decision don't have to scroll forever to try and find out where they can make a purchase. Make it easy for people to reduce friction.
Okay then. Comparison tables. They're a great tool because it gives people a very quick snapshot of what they're about to buy versus what the alternatives are. It can be anchored against price effectiveness and all these things. Super powerful tool. Think about why this matters.
So a block or a section about what... Why they should care about this. Why standard solutions won't work or don't do what they need to do and how... This is the complete answer they've been looking for. You might want to have an origin or proof story, depending on the type of brand you are. That could come from the founder. How I identified this problem. It could come from recognizing that there was a problem in the market. You want to look at the ingredients. If it's a supplement product or a skincare product, what's inside it? Why does that matter? How do they work? Reviews and proof. Obviously, want to have plenty of social proof, and that should be... There should be some in the hero section. There should be some in the middle. There should be some on the bottom. In my opinion, it's very hard to get it wrong when it comes to social proof. You need to stack as much as you can. There is a hierarchy of social proof. UGC video is at the top because it's the hardest one to fake. Then social group of images UGC images is second, and then just testimonial script is the last.
In pricing and bundles. So are we offering different tiers, different bundles, guarantees, and urgency? How are we making the buying decision easy for them to find what they want is right? How are we showing them by price anchoring that a bundle with a higher AV is actually a better deal for them?
Then FAQs and final CTAs. So if AQ is where you handle any potential minor barriers to purchase. They might have those last few objections that might be playing in their mind. Some people don't read all the information on a page, so they scroll down to the FAQs.
So you want to echo what you've said on the page in the FAQs for the people to function like that. So add to the page continuity, right? One of the biggest issues that I see in a lot of e-commerce businesses is they don't have continuity. We talk about the customer journey, and this is exactly what it means. The customer journey is they have contact with your ads and it speaks to them. They engage with it emotionally. They're then educated. They don't want education.
That is irrelevant to the thing that got them engaged in the first place. The education you provide should be building on the ad that they've seen. Brands like Grums... I'm at these new up-and-coming monster brands that come out of nowhere. They are building separate customer stories for each customer that they speak to. They have separate dedicated funds for each one that they speak to when they talk about their specific problem and their specific situation.

It's synergistic, right? One builds on one, and it completes that customer journey. So when they do arrive at a purchasing decision, they feel like they've been seen, that it's hyper-relevant to them. It ticks all the boxes.
For example, if you had something like joint supplement that finally works and then premium wellness for modern women, there's a disconnect there. I'm here about joint health. Why is my gender relevant here?
It's now not talking about joint health. It's talking about wellness, so it feels much broader. There's a disconnect. Disconnects create friction. Friction increases balance rate, reduces sales, and kills your CVL when it's matched. It can be something like glucosamine is one ingredient your joints need five.
So we've got an education ad based around that. Then Miro versus every joint supplement product. That's a continuation of that same narrative, that same story in their brain. They're like, "Yeah, this is what I was expecting to see. I'm getting more of what engaged me in the first place."
So the hero headline operates as a bridge between those two points. It's like, "You finished up here. We're going to reassure you you're in the right place here." Yeah, as I said before, proof density is important. Pages with more proof convert better. Cold readers don't trust you.
So stack proof until you close the trust deficit. The brands like Happy Mammoth, another big supplement brand, absolutely killing it at the moment. They've got oodles of social proof on their page.
It's absolutely everywhere. They've got their 20005-star reviews before you even click on anything, and then they've got... When you go into it, there are testimonials of the testimonials. It's very reassuring. It's very hard to argue with the fact that it's at least not worth a try. You want named buyers, you want comparison tables, you want numbers and stats. Hard data convinces people. 73% they're like, "I can fit into that category."
Then a visible guarantee, you guarantee should not be hidden. You should be very transparent about it. It is, in my experience and opinion, way better to refund people effortlessly than it is to fight over one sale and you could be making ten more arguments about this one customer service and things like that. When it comes to risk reversal, make it easy for people to return stuff, and then they're less likely to do it because they're less afraid and skeptical about it.
If I know something's easy to do, I'm not thinking about it. I'm not worrying about it. Right? It's almost like reverse psychology, and we can play into that. So actually very transparent, very easy returns policies typically have a lower take-off rate.
So we're actually going to look at Prime or Queen. It's an absolutely phenomenal brand. I'm sure all of you guys know about Primal Queen. Really cool marketing, very good branding, visuals, and stuff. They know who they're speaking to, they know what they're about.
So I'm going to just show you that in a minute. But basically, the page that I picked was an ad specifically talking about joint health. So I clicked on the ad, took me to a sales page, and we had this narrow versus every joint angle.
So the comparison framing above the fold, the CTA is visible with cross badges. We've got lots of education and comparisons in the top half, and then we've got timeline comparisons and price anchoring. It just does so much right.

So we're actually going to just look at that page rather than me try and explain it to you. So here you will see the Primal Queen sales page that I clicked on. We've got Mother's Day sales. We've got hyper-relevant sales. We've got our timer to increase urgency.
It's good for some brands, it's not good for others. If you're selling a luxury product or something, you don't want to do anything that's too gimmicky, but this is the kind of thing that can be tested. We've got our ad to bag symbol. There's not prototypical, really. It should be a cart symbol, though. ADTI bags are becoming more acceptable.
Then we've got this marrow versus every joint support product. It shows me I'm in the right place. Big clear picture which one of these looks more appealing. This one by a long way. I can see the stack of ingredients, I can see the packaging bright, colorful, inviting, gray, bland, boring. So there's a visual comparison here. Check the label on improvement supplement in your cabinet. You'll find the same thing. One isolated compound from the 1960s. No inflammatory support, no absorption technology, lubrication. We compared them all to the one formula that doesn't cut corners.
So right away, it's setting that up. It's reaffirming what the customer already believes or what they've learned from the ad. Most of these joint supplements are missing loads of things that they need tons of social proof here and a nice clear button above the fold. Try Miro Risk-Free. The most common objection in making a purchase is, "What if it doesn't work for me?"
Well, it's risk-free. It doesn't matter if it doesn't work for you because your absolute worst-case scenario is that we'll give you your money back. Then we have more social proof here. We've got a 365-day guarantee. Absolutely massive guarantee. They're clearly saying that we believe in our product. We believe that it's going to work for you because you've got a whole year to return it.
We've got these third-party tested, clinically studied ingredients. So this is actually very carefully and cleverly worded for compliance. Clinically studied ingredients isn't saying that this is a clinical supplement, it's just saying that the ingredients within this product have been studied in clinical situations.
So what's in it? So not all premium joint supplements are made equal. They'll be a cliche there, but it works. Here's what's actually in them, right? A simple comparison table. Everything about this elevates Primal Queen as being the obvious choice in terms of what they're actually offering and in the visual appeal of this comparison table. I only like this just as background noise and this is why... What?
Look at it. Bold, bright, appealing. It's got all these different things. If the ad did a good job, I should know what a lot of these things do. What I would probably do if I were to improve this is add maybe a single line of copy in here that said, "Why they want this thing so grass-fed bone marrow?" Support supports joint strength or something like that. Dual pathway for faster absorption works within weeks instead of months, that kind of thing. They might have split-tested this and found that actually less copy on the page works better.
But just as an observer, that's something that I might consider. So check the label on any of them, they're reinforcing that whole narrative. They're saying it's about checking their label. Have you actually looked at what you're taking? This is all they've got in them.
So they're not trying to divide attention. They've got their message that they know is working, which is "Have you checked the label? Have you checked the label?" And they're reinforcing it. That's not joint support.

That's a sixty-year-old band-aid. So they position themselves as the new forward-thinking product versus the old-fashioned kind of... "This is how it's always been done, and now they're contextualized."
So why does that matter? Well, your joint needs five systems working together. So this is their unique mechanism of the solution, if you want to look at it that way. So here they're explaining the other products that people have probably chosen or tried in the past and ruling out why they're not the answer.
So the unique mechanism of the problem is that you need this right? The unique mechanism solution is what they're offering, which is "Hit. We have all five, and this is the product that delivers that." So it provides those five things you are looking for. Try it risk-free again. Simple call to action button. Consistent, big, bright, different color in terms of optimization to the rest of the pace, so I'm not missing that it's well-shadowed so I can see it's a button. I imagine there's a high click-through rate on this and then all the reinforcements it is answering my questions. It ships fast. I get free shipping, I get a guarantee, I cancel any time, and it's trusted by over 500,000 women.
That's a huge piece of social proof. Now it's going into the particulars of the ingredients. So 2.5 million years of evidence, zero marketing budget. Okay, so they're showing that in the Primal Queen world that the ingredients that they choose are ones that have been used by our ancient ancestors and that they were strong and fit and healthy.
It's a story that works. I mean, it's not hugely true. Modern medicine has extended the life of people by decades, just in the last hundred years, but it's a story that sells because people want to believe that.
So you've got... It was survival. Eat marrow on site before the meat is butchered. How strong they were, how ancient cultures were able to walk 50 miles a day on rough terrain. They had mobility and stability.
So these are all mini case studies taken from history that fit the narrative that they're selling. Your grandmother didn't need a joint supplement. Her grandmother ate the bones, right? This is just funny positioning and it speaks to what the brand stands for.
So every piece of copying here is reinforcing the brand. Ancient ways are better than modern ways. Most supplements are weak and not giving you what you need. You need to go back to something that our ancestors used.
That's why it's Prime... Makes sense. Then another opportunity to purchase... So what's actually in Miro? So again, we've got another comparison table here where it's doing addresses, systems, and information absorption.
So what I said earlier about the other comparison table, they're actually doing it, but they've decided to separate those things out. So this is an ingredient focus and this is a benefit focus. I like that as an idea. We've got a different way of comparing things that will appeal to a different kind of buyer. Then here you've got what's actually in it in terms of dose and positioning against the enemy.
So you know, not generic tumoric powder. Curq win good. How those ingredients compound together. We've got the extra ingredient here that shows that this is allowing your body to absorb more of it. The formula multiplier.

It's one of the best breakdowns. This is such a good page if you're in the supplement niche study Primal Queen because man, do they get so much right. How long until you feel it? Now we've got another possible objection answered.
Right? Yeah, but how long does it take to work? Is it going to work for me? That kind of thing. We've got a realistic timeline. Look what they're doing for improvement in two to four weeks. So they're not saying it's going to happen overnight. They're very much setting you up for a month commitment is typically when you'll start feeling results. But there are wins that happen in between for three months, you're going to have deeper structural rebuilding.
Okay, so they're showing you that is a three-month pathway to really getting the most benefits from it. Individual results may vary, but the timeline isn't even close. So I like the positioning of this because they're not afraid to say, "Hey, this isn't an overnight cure."
It's something that you need that needs to build up in your system. Your body needs time to respond to it. Tendons, ligaments, and synovial fluid all need time to repair. We're going to set you up with a realistic time frame.
Then what you actually pay? So this is again dealing with another objection. We trivialize the price so it's less than a dollar a day. Less than a dollar a day? That makes it feel very insignificant. Whereas if I was looking at $29, that might be a consideration for me or whatever. If I buy supplements separately, I'd anchor against that. So if I was to buy glucosamine, collagen, and turmeric, I might be looking at $60 to $100 a month on average. So we're talking double to three times as much. I get seven active compounds.
So again, this is anchored against price, another very powerful comparison table. It's easy, right? It's easy to understand. I'm not having to think and figure things out, I'm just like, "Right, direct comparison, which one of these do I want?"
There was a study done, which is really interesting. So this is a little bit of a tangent, but it's a story worth telling. So there was a Coca-Cola machine in a big office building. It was doing really well. It was ticking over really well. It made a lot of sales and stuff.
They were asking themselves, "How do we increase the sales?" One guy suggested they do something that the others scoffed at. He said, "We should put a Pepsi machine next to it." They were
like, "Why would we put our big competitor next to it?" Actually, the Coke sales almost doubled and did... This guy was seen as a bit of a genius. So why did it work? The reason it worked is because when you do that, the decision goes from, "Do I want a Coke or do I not want a Coke?" to "Do I want a Coke or do I want a Pepsi?"
So when you are directing the reframe, you are controlling the story that they're telling themselves. So at this point, they're pretty much convinced they're going to take some action. So you've streamlined the action that they can take down to, "Do I want this old-school, unappealing, complicated stack that's going to cost me a lot of money?" or "Do I want this one?" It becomes a no-brainer situation because you've eliminated the excess choices. The same thing works. I don't know how many of you have got kids. The same principle applies with kids. I will say to my daughter, "Do you want peas or broccoli with dinner?" She feels like she's in control of the situation. I have created a scenario where I don't really mind which one she chooses. I've got control over that here.

It's a similar principle when we're controlling the decision-making by making one look like a really stupid decision and one make it look like a really good decision. So yeah, there's a little story for you built into this module.
So most women dealing with joint pain already... We're reinforcing that there is a real pain... Miro costs, and they're already spending more than Miro costs, right? So for less than a dollar a day price anchoring again, you get the complete system. Another opportunity to buy. We've got excellent social proof stacked here. It could be stronger, it could be a carousel with UGC videos to reinforce that, but it's already a long page. They might be looking at optimizing speed times and stuff, so there might be a reason they've done that again after the social proof. Another opportunity to buy. Ready to try the one that's actually complete, reinforcing that it's seven in one and that this is everything you need in one.
Then the best-case scenario or worst-case scenario. I really like that. So in their minds, people tend to... I can think... My God, but what if it doesn't work? What if this spiral? Okay, so you just take control of that as well. What's the worst-case scenario?
Well, if you don't feel the difference, you get a full refund. You've got a whole year to decide whether it's actually working for you. Literally, what you have to lose is nothing. Worst-case scenario, you buy, it doesn't work, you get your money back.
That's the worst thing that can happen here. Best case, you get joints ancestral, no nourishment, which is reinforcing the whole theme of the brand and the angle that they've taken. Wonder why you spent years on incomplete supplements?
So in summary, our final comparison table. Again, just beating people over the head with this is better. This is bad. This is the one you want, this is the one you don't. Load to comparison tables built into that and then another chance to buy.
So here they've got their main offer, join Prime Queen. Today we've got extra urgency in this form of the table. We've got buy one, get one free. May has a high risk of selling out. We've got our purchases made today. Got the Mother's Day offer, which is the kind of holiday offer that they've got going on right now. Three months, auto-ship by two, get one free.
So they're increasing their AV, and they've already anchored your mind to the fact that three months is the minimal time to get payoff. Why would I buy one month for £33 when I could buy three months for just £66?
What do I get? They've then got a free third bag, I've got a free bamboo last job, I've got a free on-the-go pill case, and I got a free mystery gift, which is exciting for USA shippers. The value stuck on here is massive. I would be really shocked if many people took this offer.
Again, visually, they visually anchored it as well. Which one of these looks more people's you right? This one, clearly, this isn't a bad deal, this is a great deal, but that is the no-brainer deal, right?
That's the no-brainer deal. Then they've got their FAQ's. So you can see here really strong page, really well put together, and it's a sales page, right? They are pushing the offer, but there is education, comparison, anchor, and reinforcement. Everything you would want to see to make people drive towards the purchase. Phenomenal example of really good copywriting and really good design. Just really good everything.
That's why I highlighted them so there's no need for me to tick through. AC, we've done a pretty good job of that. So how to build a sales page. You want to match the traffic, match the hero to the ads. You want to build comparison tables? You don't need as many as Primal Queen, but

you can see how effective they are in that circumstance. You want to stack proof at every section.
That's the one thing I think Primal Queen could probably benefit from doing a bit more of. I think they could do with some UGC videos on that. I think they could do with having some social groups above 500,000 plus women bought this because it feels quite abstract. Whereas I would like to see more social proof further up the page. Once you built your pages out, you've started running them, you're getting a good conversion rate that you're happy with.
It's hitting your KPIs. Go speak to Washington's team. What more can you squeeze out of it? How can we make it even better? Is it too copy-heavy? Is there not enough explanation? Is it lacking social proof? He and his team can help you figure out what's going on with that.
So this is where you can do it. You can outline the eight blocks. You can go and find a really good DTC brand in your niche and say, "Hey, what are they doing? I'm going to model their structure but make sure it's hyper-relevant to my audience."
That's a really good way of doing this and figuring things out that way. So build the page once you're happy with it. Speak to us. Get involved with co-optimization because a 1% increase in your conversion rate can translate to hundreds of thousands of dollars. It's phenomenal. The impact it makes, and it shouldn't be overlooked. Okay, so that is the end of it. I know it's a slightly longer one, but there's a lot to cover, and I wanted to do a live breakdown for you guys.
Next up, we're talking about creative diversity and targeting. Many of these modules are going to overlap with the other EA mentors. I'm just giving you my take on them from a copyrighting perspective.
But for email, Josh is your man, for co-optimization is your man, and for creative strategy, Amy is a woman. So this will be my take on it. Look forward to seeing the next one. Speak soon, guys.

Transcript 26

David Briggs | 00:00
Today on Module 26, we're talking about creative diversity, what it means and everything. My housekeeping at the start. Amy is an absolutely genius-level creative strategist. Absolutely attend her calls, her courses, and get her advice. Go through her course.
It's phenomenal. I went through it as well and learned a ton, so I can't recommend it enough. I think it's one of the best courses on creative strategy. Certainly, that I've come across. So today, I'm just talking about my take on creative diversity.
This is very much from a planning copywriting perspective. Copywriting, in its purest form, has evolved a lot. There are still some old-school copywriters who will tell you copywriters just copy, and we just write the pages, and that we've always been strategists to a degree we have because you cannot write effective copy if you do not understand your audience's desires, goals, pains, and what keeps them awake at night.
So research has always been the backbone of good, powerful, and effective copy. However, diversity has changed the way that people think about copy and targeting and all this stuff. So in the Andromeda era, loads of people are panicking because they couldn't get away with just changing a headline or a background color or something.
But actually, if you know who your audience is and who you're speaking to, you can completely turn the Andromeda update into a massive advantage. I know Matt covered this on calls as well. The circular scaling system and so on. How to find angles.
So this is just my take, and I hope it will be valuable to you. So let's get into it. So a lot of the time, the targeting layer used to control... Okay, so Andromeda now reads the creative and matches it to the people.
That should be good news, even though people don't like change. They have systems in place that worked, and they weren't confident in those systems. What it means, though, is a strong creative finds the right buyer faster than you can. There are some phenomenally skilled media buyers, but media buyers, in my opinion, are now amplifiers.
So you need to have a really strong creative and then a really good media buyer. The likes of Marion and his team can take you to the moon. However, if your creative is weak, single-note, or is just different colors of the same flavor, then it's not going to make the impact that you need.
So Andromeda needs different signals to learn who buys what. Okay. It's almost the digital equivalent of "show, don't tell." So before you put your target audience in and all this stuff, you would be telling it who to find. Now you are showing it who to find, right?
That's the biggest distinction between the two things. So, four ads that look different, four ads that are different. Okay, so there's a lot of confusion about what it actually means to have diversity.
So I pulled a random product. Let me just share that random product with you. Where's it gone? There we go. So I was just looking on AA today. I pulled a random product. Here was the random product that I pulled.
It's a pain relief back brace. Pain relief is obviously astronomically big, worth trillions, so it's for the lumbo wrap. Okay. I found an ad on AA today. I went through to their sales page.
That's the one I have here. So that's the basis of this. I'll include the link at the end of this, so if you want to go look at it yourself, you can see it. So "web lumbo wrap variation" would be the

same lumbo wrap photos with four different headlines. Finally, stand without pain and end your back pain today. The "what that works" stand all day.
It's going to look at all of those as the same mess and same target audience, same everything. Whereas in terms of diversity, you can have four ads that share zero DNA, so it could be something like a huge selfie video of a plus-size woman. Lumbo Wrap is specifically for bariatric people who are overweight. It could be a founder explainer with a role, maybe telling a personal story from their life or... It was like someone in my family was struggling with obesity and chronic back pain because of it. They needed something that would help them get going in this. It could be text on a green screen, "Can't walk ten minutes," kind of a role voice-over style. It could be a comparison of static versus other braces. They're sending four different signals.
It's speaking to different audiences in different ways, and that's what true diversity is. So you want to vary across different axes, not just one. So you want to vary angles. So is it identity mechanism, social proof, problem-solution? All of this, and formats.
Okay, so different formats. UGC videos, talking head green screen where it's commentary, static comparisons, text on a background carousel, music. You just want to have diversity, right? Different personas.
Okay, so, for example, a sixty-five-year-old grandma is going to be in a very different point in her life to a thirty-year-old plus-size shopper or maybe someone who's post-surgery recovery or something.
Then hook styles as well. Curiosity questions, call out social proof drops, before-after reviews, problem statements, these kinds of things. Everything we've done in the previous module is compounding.
So it makes it way easier to know your personas, who you're talking to, what they're going to respond to, what their emotional beats are, and all this stuff. It's not as hard as people make it out to be.
So same product for different angles. Here we've got identity, so we can do an identity angle. So stop planning your life around chairs. What's the underlying message there? We're selling dignity, freedom, and presence. We're taking away that pain of being the one that has to sit down or doesn't get invited places because they know it's going to be an issue. We could do the plus-size fit. Most bras aren't made for real bodies. Let's be real, most of these bras are these velcro ones that they don't fit most people.
So we can sell inclusion. This is designed for you if you're a little bit on the bigger side or if you're a little bit heavier. Loads of brands right now are doing very well by appealing to big people. There are a lot of apparel brands that are designing their clothing in a different way to help people that are overweight feel more confident in what they're wearing. It could be a mechanism angle where you explain the dual compression on the hip and lower back. Most braces are only doing one thing
but actually, if you're not supporting both areas, then whichever one is supported, the other one is taking the stream from. So you can sell an engineering story. How we've identified a problem with current offerings and changed that it could be social proof.
It's featured in Vogue and Forbes. Safety in numbers like lots of people have used this. The reviews are really strong. All of those things are creating diversity in the camp. They're going to appeal to different buyers for different reasons.

So it could be four formats as well. Let's talk about formats. It could be a UGC selfie video, maybe. There's a plus-size woman in her bedroom. I haven't been able to do the laundry in two years.
That's her pain, that's the struggle, that's the dimensionalization. We can share that moment with her, share her pain and how she overcame it. It could be a founder explaining a talking head. Be well, two minutes.
Look, let's look at standard braces. I've got the top five Amazon braces right here in front of me, and they've all got one problem, right? That's why we redesigned it, so it could be explaining it from that perspective. It could be text on a green screen, a static thing, right?
So can't walk ten minutes, this wrap solves it. We've got a static image. It could be a comparison carousel. Something like Lumber Up versus three competitive braces where you're measuring up fit, comfort, plus sizing, pricing, all that kind of stuff.
These are just quick examples, but you can see how variations occur. Asana, right? Obviously, going back to our research modules, you would know what your performers are because you've identified them all.
So it could be the grandmother, okay, who wants to babysit the grandkids without bracing for collapse, without worrying about not being able to get up off the floor, without worrying about picking them up if they're crying, that kind of thing. The pain point is like dignity at family events. No one wants to be the useless family member that can't muck in and help. My grandmas are there to be looked up to.
It's embarrassing if you're the one that can't do that. So speaking to that could be plus-size shoppers, right? Look, I know I've got this problem. I know I'm overweight. You can do a cool-out like that, right?
But right now, this is why I need something to relieve the pain so I can get myself back on track so I'm not constantly thinking about it so it's not overwhelming my life. Why isn't anything made for me?
Well, this is... It could be a working dad, right? Maybe he's on his feet, twelve hours a day in a factory, hard physical work. Lots of lifting and moving, stacking and all this kind of stuff. He's supporting his family. He can't afford to slow down, and he knows that he's got this pain, and it is an issue.
So speaking to that, why it could be a recovery patient, someone that's post-surgery fibromyalgia or stenosis or something like that. And nothing else has been right for them, nothing else has given them the support they need.
So different person-signers buy for different reasons. Each one needs ads written to them to speak to their particular kind of struggle that they're facing. You don't want to try and target all of them in one ad. Generalist ads just go on mis because it's like that sounds okay, but it's not necessarily talking to me. It feels impersonal. It feels like someone's just trying to broadcast rather than speak to you.
So different hooks and styles. If you're over 60 and your back gives out in the light in mid-afternoon, this is for you. Very direct call out, right? If you're over 60, identify the audience and your back gives out by mid-afternoon, call out specific pain point. This is for you.
Okay, it could be curiosity. Why do most back braces dig in around the hips? So this would be for a solution-aware audience, right? People have probably tried back braces, but they're finding them to be uncomfortable.

Well, we offer our solution, which is ours offers hip support. When you compress just the back, then actually you're protecting the back muscles at the expense of your hip flexors and your hips are bearing that weight. It could be something like a problem statement. Standing through dinner shouldn't feel like a marathon.
Okay. Like the pressure that you have to be present and not be the vulnerable one that everyone's looking after, but internally you're counting down every second until you can sit down and relax and breathe and take the pressure off.
That's a horrible feeling. It could be social proof-driven, right? So 100,000 women over 60 have stopped planning their life around chairs. Here's how you can do the same. Then you go into the problem if you suffer from... Or if you've experienced it at the relatable pain point.
So the same buyer in this case, four different doors, right? And it will... The algorithm will go out and try and find who's an appropriate fit for those specific... How do you do something?
A back support brace seems like it could be a really hard product to market. It only really solves one problem. It's not like a supplement where you might get multiple benefits. It's not like skincare where it could solve multiple problems.
It's only solving the problem of back pain. So how do you get diverse with it? You look at your research and your personas and who you're targeting, and you can benefit from your product and you can do a bunch of things. UG Selfy, grandma persona, right? UG Selfy plus size persona, a founder explainer, comparison carousel, different text style ads to test messaging before and after statistics from a recovery perspective. You just see video of someone working in their office environment, right?
You see video of someone doing recovery. It could be a green screen press kind of stuff with a social proof angle. It could be curiosity, a founder origin story, how we came up with the idea, and a customer review compilation. There are so many different ways you can take it to approach your audiences. Found ads are doing really well at the moment. There are animation ads that are doing really well at the moment.
Pixel style, clay animation style that are doing really well, and they're easier than ever to produce now with various tools. You can design a Pixar-style character in Nano Banana or GPT image too.
And you can animate them with clipping and build a whole storyboard, animating your character, talking through the pain point. They're doing crazy well. Then you want to keep... You want to refresh, right? You want to constantly be feeding it new concepts and stuff. You don't want to sit on your laurels and be like, "This one's working, so we're just going to stop there."
It's about constantly refreshing depending on how many ads you're running in your account and how many you release in. And Marin's the man to ask about that. Marin and Amy are the power couple.
So we're way of expressing it. But Amy on the creative strategy side, Marin on the media buying side. Go listen to everything they've got to say. They know what they're doing better than pretty much anyone I know.
So get things going and iterate. If you find, for example, that the grandmath UGC style videos are doing really well, make more ads for that persona. Talk about the mechanism in a way that Grandma would understand. Talk about... Tell a founder story that's specific to Grandma. You can diversify it that way too. When you start finding and nailing down those winners so you

know what you need to do, build a creative diversity map. You've already done all the hard work in the previous modules. All the foundations are built, and you'll just build on top.
So pick your product, identify four genuinely different angles, right? List different formats that will fit. Map out the personas with four different hook styles. This is how you gradually build out creative diversity. It doesn't have to be this overly complicated process that a lot of people are making out to be.
It is simply that different people resonate with different things at different times. So how do we make sure we are covering all our bases through our creative diversity? So diversity is your targeting, and volume is the engine.
Okay. This does not mean the scattergun approach that a lot of agencies are selling right now where they're like, "We'll give you a thousand images as what we're going to do with a thousand images." I'm going to burn through budget, which isn't small. You still want to be targeted. You want to increase volume steadily and with purpose and get things moving quickly. Keep refreshing ideas and keep testing new angles to keep speaking to new audiences.
Okay? For media buying strategy, definitely get involved with Marin's cause. He is world class, no question about it. With the creative strategy, get on Amy's courses, she is world class.
Next up is Persona splits, and it's how to iterate without fatigue. Okay. So we're going to cover that next. I'll see you on the next call. Cheers, guys.

Transcript 27

David Briggs | 00:00
27, and we are building on what we did in module 26, the persona splits and iterations. So once you do establish your win on what you then do, right? What are your next steps? So from a copyright perspective, it's about using what's working and not staring at a blank page, right? We should always be trying to use other people's learning, other people's results, our own findings, and creating feedback loops.
So when we start finding winners, we start diversifying on those winners, and that's what this module is all about. Let's take a look at what's inside. So typically, the second ad is harder than the first. When you write your first ad, it's like the strongest angle that you can find based on all the metrics that we looked at in the previous modules.
Is there emotional resonance? Is there white space? All of these things, right? So pretty much anyone can write a pretty decent ad when you've got a fresh angle and a new kind of mindset about it.
In the next four, then the next eight. While keeping one generally different from the other is where most copyrighters and most brand owners struggle. You feel like you're burning through all your ideas quite quickly because you're not breaking them down enough. You start end up producing variations that feel different, but they're reading the same.
One way to avoid that is the persona split. Okay? This is a writing skill. It's not a meta strategy or anything like that. This is in my lane. This is to do with copywriting. So that's the focus here, right?
We've got the same offer, same product, same price, different persona. One thing I need to say about this as well is it can be more difficult depending on the type of product you sell. So I often talk about single-function products. That means it's a product that only does one thing.
If I'm selling a stapler, for example, people are buying a stapler because they want to staple things. I can't sell it as a multiple, solving lots of other problems. It is for combining documents and piles of paper into bundles that don't get lost, mixed up, or whatever.
That's its single function. That doesn't mean I can't be diverse with it, because I could speak to office staff. I could speak to moms and parents of kids that have loads of documents or loaded pictures. Just keep everything together. I could be speaking to lawyers. I could be speaking to people like me that have a home office like many of you do, and just like, I've got papers everywhere and stuff. My organization skills could do some work, but you can have diversity within that, right?
So how would you mix things up? Everything about how you talk to the buyer does... Okay, so the product doesn't change, but everything you... How you talk to the buyer does. So it could be the voice. How do they describe their own pain?
Right? So someone that's a parent and their kids are bringing in a load of homework home and there's a big mess or whatever, right? They're going to have very different vocabulary and descriptions of their pain and their frustrations. Their house being trashed or feeling like they're losing space where everything's cluttered.
Someone who has a home office that's like, "Look, I've got a lot of paperwork. I do a lot of stuff. I've got tax bills and receipts and things I need to keep track of. I need to get organized." The voice is very different. The solution remains the same.

Okay? It could be the same as I just said, where it happens. It could be in someone's home, could be in a home office, it could be an office building or something. It could be the kitchen, the bathroom floor.
The scene can change depending on who it is, right? The proof. So what proofs are going to resonate? If I'm selling this to Martins, then having a whole bunch of lawyers going to get it is the best state play I've ever used, and they're not going to care.
That's great. You're a lawyer. You've probably got some weird criteria of how you determine that, right? However, I'm not. Testimonials from other MoMs like "My God, I've finally got things organized."
Social proof of that. Then CCA free framing. So while they're getting back... So you're speaking to a monk, it could be "Take back control of your home, get the files organized." That kind of thing. Take back control of your home.
If it was someone in their home office, it's like, "Don't be scrambling around for that important document when the tax man comes knocking at your door." By different CTA framing, different relevance to different people, right?
So in the case of the Lumbo app I used in the previous module, the hook line can change for each one. Okay, so notice, I want you to pay attention to what's changing and what stays the same. So my grandmother asked why I always sit down at her birthday parties. That was the moment I knew. I returned three back braces last year. None of them fit. Then I found one that was actually built for my body. I'm 53. I do sight work. I can't afford to take painkillers and run machinery, so I needed something else.
First one is identity, dignity, scene, a kind of family event. The second one is inclusion, frustration with the category. Third one is practicality, livelihood, and no time for downtime. Same solution, same product, but very different people speaking to it and the people identifying with their specific problems in very different ways.
Okay, so the product is identical. What stays the same? It's the lumbo wrap. The mechanism stays the same, the offer stays the same, the guarantee stays the same. The core promise, which is it's going to provide you the relief you need to go about your day.
That's all the same. The changes are the voice you'll echo in their words. We call it the Power Effect or the Echo Effect. We're using direct customer testimonials to describe their problem in the words they use. The scene changes.
So what is their lived moment, their dimensionalization? Right? The show doesn't tell portion of this. If you're a site worker, it should be hyper-relevant to a site worker. If you're a busy mom, you should be hyper-relevant.
If you're a busy dad, we're gender-neutral here. The proof, right? That changes because it has to be relevant to the audience, right? If, for example, I'm just starting out, I've just decided I'm going to go to the gym, I'm going to start running or whatever, my taste in what's relevant to me as a runner is going to be quite simple. I'm just starting now.
However, if I was about to take on three marathons over the course of a week, then I would need some really good high-level information about why I should buy a certain type of running train.
That's going to be an investment in my health and my success in this, so it changes, right? The stakes change. What are they scared of in the examples I just gave you, Dad? Scared of missing work.

Maybe you're supporting a family. Grandma's scared of being the liability. What's at stake matters. Then the CTA framing. So what does yes mean to them? What are they trying to achieve? What would the result look like, the real relief that they're seeking?
An iteration matrix, it's not a production schedule, it's a writing tool, right? We're using it in order to extend, elaborate, and build on the learning that we've had in our account and where there's been success.
Okay, so what we don't want to do, which some people do seem to do, is they think, well, if I'm speaking to a new persona, I need to start completely from scratch. And then they go back to square one, looking at a blank page, going, "My God, I'm really stressed." When you find winners, that should be an exciting time, but I want to iterate on this.
So you want to use that same back one, right? So you can start with a piece of copy that's already working and hold most of it constant, right? You're changing one variable on purpose, and then you're writing the next ad as a deliberate cousin of the first.
I want you to think about it as a cousin. It's not an identical twin, all right? It's not even a twin. There's enough difference between those things and who they're speaking to and how they're targeting for you to say, "I can use this framework."
That's worked well, but I can deliver it to a new audience through my messaging and so cousin, not twin. So in the previous one, we talked about this before, how can you iterate on a copy level? Because SOA swaps, right? Same book structure, same body, new buyer. In the scene, the grandma becomes the plus size or busy dad, or busy mom, or overworked solicitor, whatever it is, right? A hook swap can be the same persona, same body, but a new opening called out becomes a curiosity question and engages different people in a different way. It could be a scene swap.
Maybe it starts as someone talking head in their home. They're walking around, they're like, "Look at all this mess, all this clutter." Or if we're talking about the lumber rat, maybe they're at the gym and they're sitting there in the gym locker room or whatever, and they're like, "I was out for months. I couldn't get back to lift in. I couldn't do what I wanted to do, and I got this thing." The next scene is maybe someone at home where it's like, "I can get on with my day, right? I can do my laundry, I can put the clothes out on the washing line. I can do all these kinds of things.
It can be a voice swap, right? So the founder's voice can become a customer voice. Maybe the founder is explaining the mechanism, and it works really well. We switch that to a new GC person like, "My god, just got this route."
I've tried ten before. I don't know why I decided to buy another one. I'm so glad I did. Here's how it works. Here's how it looks. Look, wear it under your clothes, it's not really obvious, it's not going to be embarrassing like some of the ones I've tried. You get my point. Iteration, right?
So here, if the winner was grandmother UGC and my granddaughter a wire sign at birthday parties, the persona spot could be my daughter Roswe. I haven't been to her dance recital. That was the moment I knew. Same DNA, different persona.
We're speaking to someone who's potentially overweight and looking for a solution. It could be a hook swap. So grandmother curiosity question instead of a statement, right? "Why does standing through a birthday party feel like a marathon?" At 65 could be a scene swap. Same grandmother, your moment at the grocery store used to take ten minutes now and plan it like an expedition.

It's telling that sort of story of "As I notice this pain, I'm planning more and more my day around it. I have actively thought about things I used to just get on with and do, which is really good at dimensionalizing the pain and aggravating the reality of what pain means." You are less spontaneous, you're less independent. All these kinds of things. It could be a voice swap. Alright. So same thing, same sing. I found a voice instead. My grandmother gave up family parties because of her back. That's why I built this. So Firebads, it's all got one starting point for something that was working.

It's got the same kind of structural DNA that we're able to diversify. So what do we want to avoid? We want to avoid variations dressed like iterations. Variations are when you have this twin version instead of a cousin version. The twin version is where you're just changing one thing, but it's sending the exact same signals out.

Stop planning your life around chairs. Stop planning your day around chairs. That is not different, that is the same message with the word swapped. Stop building your life around where you can sit. Exactly the same thing, more words swapped, exact same messaging going out there re-iterations would be like that. Stop planning your life around chess. Why does standing through dinner feel like a marathon? My granddaughter asks why I always sit down.

Okay, different signals. So a good thing you can use is Claude. You should be building out your Claude with all your information anyway so you can copy in your winning script and say things like "Generate three iterations. One person swap, one to swap, one scene swap. Keep the body your for the proof it's identical. Change only the name variable. Each iteration must read like a different writer working from the same brief and that is schical propt, right?"

Because if you gave ten of the best copywriters in the world the exact same identical brief, all the product information, you will get ten very different takes on it. And that's a good thing. I often say with my clients, I have a lot of success with clients, but not everyone fits every scenario. Okay? There will be brands I work with where there are people that might be a better fit. Maybe they've got more lived experience that they can bring into it, right? So you want it to feel like different writers working from the same brief.

That's why I choose to work with another senior-level copywriter who is my partner. He has a different take on things. So we discuss it. We do the thinking together, the planning together, and then we go from right separately.

Then we look at what each other has done, what's worked really well, and what we like about each other's work. We get the ads into an account to test and if his style was out before him, lifestyle would go great. We've learned from this. Let's push over to this. This is clearly what the audience is responding to. Let's do more of this and less of this.

That's what feedback loops are for, to kind of evolve your direction to get more honed in, to produce more winners in a short space of time. Okay, so that prompt is really valuable. So what do you want to do?

So 3% as plus an iteration plan, right? So pick one product for your brand. Your hero product is the smile. It's supposed to start the one that's got the best kind of, that kind of metrics that requires the lowest breakeven brows or whatever your priority is right now, that kind of thing. And then you want to write three for outs, same offer, different voice scene proof CCA framing for each one. Because, it's a way of training yourself in how easy diversity can be when you know what it means and how to do it from a copywriting perspective.

Okay, so pick the strongest of the three. Market is your starting point, right? Write three iterations of the starting point so the swap hook, swap, scene swap and then read them all loud right? If they sound.
If two sound like the same writer, rewrite them. Maybe one. You kind of make really punchy through lots of very short sentences. Maybe one's a little bit more of a kind of storytelling voice. When you can see all the pieces and how they fit together, it becomes really easy to just keep assembling and reassembling in different ways. In previous modules I said that copy is about blocks. Blocks are gray. My daughter's two years old. She's got blocks. You can organize those blocks in pretty much an infinite number of ways because the pieces fit together when they are based on research, on what's proven and what's working.
So we can swap out the red block for a blue block or a green block or a yellow block, right? Each with a different kind of identity, but we're still building the same structure. So don't write more variations, write more conversations. This is about how you diversify and create lots and lots of cousins of your winners and not direct clients. Not identical twins.
Next up, we're going to be talking about directing AI to produce winners. What I will say is you should be using all the information that you have collected for your brand and crew, building out a Claude project that understands your brand or person. The kind of language we've used here, the strategies we're developing because this is going to be really important for the next phases. It doesn't take long. Build the documents, get the information, and download them as a txt doc. So you're saving space in your Claude project wherever possible. Upload them to your projects and start building out your brand-based Claude is going to help you a lot. Anyway, I'll see you in the next one. We're talking about directing AI to produce winners. See you there, guys.

Transcript 28

David Briggs | 00:00
Of the new copy, we're going to talk about how to direct AI to produce winners. This is kind of an overview of how to get better output from your AI. I spent. You know, I was one of the first people to use ChatGPT. I was in one of the first 1% of adopters when it very first landed. I typically use GBT PO. PO's great.
It's kind of all the different language. LL LMS built into it. You can switch between. So you can switch between Claude, GBT, Gemini, Grock. You can kind of see how they compare. I think it's worth at I use Claude for most of my stuff at the moment, but the new GPT at the time of recording this, the new GPT update came out and I'm keeping on top of comparing.
So what I recommend is if you use like a couple of tools, make sure you rebuild your projects on both platforms, right? So all your eggs are in one basket. Because in this kind of AI race, there's going to be leapfrogging.
So Claude is going to be better than GPT. And then, you know, there might be other competitors that come into it. I use things like Trend Track, Atria get Hooked. There's a whole different array of tools available. I don't have a recommended list purely because the tools that you use regularly are the ones that are right for you.
So whatever it is that is saving you time and resources whilsts not impacting your productivity, that's the right tool for you. But they're just a few of the ones I use now. The golden rule for all AI Absolutely everything is generic input gives generic output.
Okay? And basically that means garbage and garbage out. If you are not prompting your AIIS properly. If you're not building projects, if you're not putting things in context, if you're not showing examples, if you don't know what you're looking for, AI is just going to amplify and produce greater volume of junk trash, unusable crap.
And that's what is a good, I'd say a good 75% of the market right now. They think that playing an extreme volume game is the answer, and it's not. It's always going to be quality over quantity. It always has been that way, and I would rather have ten very well-thought-out scripts that are connected to my ICPs through my research using real customer language, talking about real pain points, meeting them where they are appropriate for the sophistication and awareness levels than 150 scripts that aren't going to do anything.
So as I said, I use AI every single day to vary in degrees, but I use it as my co-pilot or my subordinate. It is not leading the thinking, it is not making the decisions. That's where you, as the expert, need to be doing those things, and where I, as the expert, do it in my workflow.
Okay? So yeah, I mean, most AI copies badly because the input's bad. So, if you say, "Write me a Facebook ad for a bomb," it's going to give you the average. Okay, so in case you're not aware of how LLM's work, large language models, they are algorithmic prediction tools.
So based on the input that you give them, they predict the most obvious word that will come next. So if you think about it, kind of like a funnel, when you have a very general prompt, it has access to every single possible combination of words, so it will find the most average, the most generic thing.
That's what it does. The more you prompt it, the more you refine it. You push it further down the funnel, and you restrict it so it is far less likely to pick the generic words because you've basically ruled them out.

So that's the way to think of it. More information is like pushing your LLM to the bottom, where it has to be ultra-selective about what it chooses. Okay, so AI hasn't met your brand, it doesn't know your avatar.
So if you're going in blind, it's guessing at all these things, and when it's guessing, that means it's just finding the most generic output possible. You don't want that. So this is about what you do first.
So whatever tool you're using, whether it's GPT, you can build custom GPT or whether it's CED and you build a project, the same principle applies. So a Claude project is basically a persistent context window. What that means is once you upload all your documents to it, every time you open that chat, it has all that information already.
So it's not like starting fresh chat every single time and having to individually upload the documents. So you want to teach it about your brand, you want to teach it about your ICPs, you want to upload all that information.
So when you come to it, you're starting at that point, you don't have to keep pasting things in, right? Not only is it a brilliant investment of your time, you can refine those documents as you go along as well. When you start noticing an ICP is performing particularly well or certain angles are blowing up for you, update your projects, and you can spend more time doubling down on things that are working and less time exploring options that haven't been paying off.
So essentially this is what I would do as a copywriter. I talk to the brand owners, I look at the reviews, I look at competitor analysis. I do all of these things to get a complete picture. So this is how a senior copywriter operates. You have to have the context. You have to know where your position is in the market, who your direct and indirect competitors are, all this kind of stuff, right?
In the course, if you've been following it and doing the steps as you go along, you'll have all of this already. So all of the modules from one right through up until this point can live in your Claude project. Once you've completed them, you can just put them in there.
So module 5, for example, is your Desire diagnosis module. Module 7 is your objection mapping, and module 11 is your brand voice words you use, words you don't use, right? How do you make it sound like you're at the top of the funnel direct response stuff that's not as important? But when you start writing longer-form advertorials or branded advertorials or LPS or product description pages, your voice really does matter to differentiate you from competitors. There's the angle mapping the story as found, origin story, customer transformation, all of these things. When you upload that information, you can then draw from that.
That all makes your outputs much more valuable. So on top of the course frameworks, add the things like "Only you have..." So that's like the brand's actual materials ultra-specific to you, right? So things like review export, put them on the CSV document, add that prior winners, right?
So you're building from a base that you know has been successful. Your own origin story. You can add things like page URLs so we can understand your product. You can look at offers and pricings, you can look at mechanism details. What have you actually paid for clinical studies? How does it work? What's the technical truth about the product? All this kind of stuff.
I mean, I picked a random product again. Sendzio, never heard of it. Looks like another kind of white-label drop-shipping product, in my opinion. There are a trillion of them at the moment.
But yeah, I mean, I've included some elements of that in here. So how do you, as a copywriter, actually use AI? Okay, so here are three ways. So the AI does well the more information it has, so once it's set up, you can start using it.

But none of those prompts are going to be right for right. So first of all, we can research and ideation so you can surface patterns, generate angle lists, find buyer language, map objections you missed when you've got that information in there.
Let's say you've got a thousand reviews for your product. It can go through those reviews, it can pocket those reviews by desire, it can pocket them by biggest opportunity, all of these things, right?
It's great for first-pass drafts, right? Lots of you are wearing a million hats in your business. You've got a lot of things on your plate, staring at a blank page, thinking, "I've got to write some copy."
It's not where you want to be, so it's good at generating first drafts of hooks, body copy, email sequences, that kind of thing, right? But it will need to be cleaned up. I have never been able to ship, and I've been using AI, as I said, every day for years now.
I have never been able to ship something that hasn't been edited. Sometimes it's a lot of editing, sometimes only a little bit of editing. But it needs editing and cleaning up. You need to make sure the verbiage and the words it's chosen are actually correct for your audience. Is it something the audience would say? That kind of thing.
It's good for iterating on winners. So you can take a winning ad that's performing well and you can do a persona swap, hook swap, and scene swap. Okay, so it makes module 27's work faster, more efficient, and less taxing for you.
The way to think about it is when you give a brief to a creator, a copywriter, or a video editor. Your prompt is your brief. So think of AI as a junior copywriter. Really fast, really ambitious, but really inexperienced. Doesn't know whether it's right or wrong.
Okay, so taking that example, I had a generic prompt, which would be something like, "Writing a Facebook ad for Sense Theo Miracle Wall." Now, if I just say that because you've got product base, it might try and make it fit the project base, right? It will try and fit it to an avatar because you've done that groundwork, at least, which many people don't do.
But if you were giving this to a copywriter and you just said, "Hey, just go write me an ad for this Miracle bar," they'd be. They'd have loads of questions too. What are they going to do? They're going to play it safe. They're going to pick the most obvious angle because they don't want to fail. AI works similarly, so an informed prompt might be something like using the avatar, the diabetes-related edema persona, and the comparison angle from the project. Write me three Facebook ad hooks, each with a curiosity question, each one under 15 words. Use by a language from the reviews, not category language.
So each instruction I am giving it is limiting the scope of what it can actually access, which is forcing it to use the information I want it to use. This is fundamentally how you make AI work for you.
Another prompt example is like the buyer language extracts, right? So read the customer reviews in this project. Pull out the ten most repeated phrases buyers used to describe the problem. Pull out the five most repeated phrases they used to describe the relief. Don't paraphrase it or soften it. Give me the exact words. Group them by emotional state: frustration, hope, gets some gratitude. This is for ad copy. I need their words, not mine.
So it could go through 100 reviews in about five minutes and you would have it all grouped. This is what they're saying. This is how they're describing it. This is the main emotions they're tapping into. This is how they feel afterwards.

You get a much broader picture of your audience. It's all based on real, usable information and it's based on your data. So you're making data-driven decisions. Okay. As I've said in previous modules, whenever we say something back to someone in their own words, it's called the parrot or the echo effect, and you can use it in real life too.
If you're going to a job interview or something, can you notice there's a phrase that the interviewer is saying repeatedly? Stop using the same phrase, and they'll immediately think higher of you than they did previously.
It's crazy how these principles, psychological principles, actually influence all of our lives. And the people that seem to be really charismatic, they do these things on default. They do it on autopilot. They just have it programmed into their brain, ready to do those things. Echo body language. We are doing the same thing but through digital, right?
So when we are showing ads, we want to mirror how the customer looks as the aspirational version of themselves. We want them to feel seen and represented. We want to show them that we understand them because we are using the same language as them. All of these things work to be the first draft generator.
So this is number two. Okay, so using the persona pace and then put the persona in and the angle name and the bio language extract earlier draft free Facebook ad hooks. Each one under 20 words, each one a different hook style, cool our curiosity question problem statement, no marketing language, sixth grade reading level, use contractions, read it aloud.
So a couple of things on that right, you can see where this is going. Sixth grade reading level makes it easy to access. Again, I've said this before it's not because people are stupid, it's because they're distracted, they're busy, they're not giving your ad a hundred percent of their attention, they're not looking at your email and going, "I'm going to sit here, switch off everything else, tell my kids to be quiet, I'm just going to focus on this." They normally scroll it. They're cooking dinner. They're putting out a fire or something.
There's a lot going on in their lives. So it needs to be simple so they can get what you're trying to say quickly and easily. They know what it's about, and they know what action they're going to take next. Use contractions. Very rarely do people say things like "Do not do this" and "You should have done this." They say "You should have done this," right? Contractions make it sound more human and more authentic.
Okay? And obviously, you want to say to it, "Read it aloud before you give it to me." If you trip on it, rewrite it. Now, this is daft. It sounds silly because, obviously, the AI isn't going to read it out loud, but you are by prompting it that way, you are forcing it to think about the structure, which is how short and long sentences are and the readability.
So it analyzes what its output is in a different way. So the iteration generators a number three, right? So here's my winning iteration three using the move to module 27 the persona swap, a hook swap, and a scene swap keep the offer mechanism proofbeats identical. Each iteration must read like a different writer working from the same RO brief, not the same writer. Rewording the original. That little clause there...
That's the key to getting good iterations. So set up your project and run the prompts. Create a new Claude project for one brand, ideally your brand. Upload the course deliverables, right? Particularly 5711131826 and 27. They're the minimal ones.

But as you go through the course content, you're going to find the areas that are going to be most useful to you and what you're trying to achieve, and just put those in, right? You got access to all the transcripts.
So everything I've said on these calls can be uploaded too. You can put the raw transcripts in. You can make them hyper-relevant to whatever it is that makes it work for you. That's the key here.
Then your brand assets. So your reviews, your prior winners, your origin story mechanism offer. So it understands who it's talking to, how it should talk to them, and what it's talking about, the who, what, how, right?
That's the three big components that are actually going to create winning copy. Run the bot's language extraction prompt, save the output, and then that becomes a bank of hooks. Recycle their language back to them in different ways, but keep the raw words they use. Run the first draft doing right into on a persona. Edit the output and note where you had to rewrite because you can tie it up if, for example, you're seeing every time it writes it doesn't transition from the agitate section into the product introduction.
I know I need to help my AI get better at that because I'm having to continually rewrite this transition part. Remember, AI is the junior, you are the copy chief. So the best way to think about AI is if you were just to hire a fresh out of college copywriter.
They understood the basis of language, but they had no real depth of understanding about marketing. But they were trying to please you. That is who AI is. You are the senior, the experienced, the brand owner, the founder, the person that really understands.
So you need to copy chief for it, the project itself, and the prompt you give it. That is the brief. So the more information you give your junior, the better it's going to be. There's the link to the store that I took the Miracle Barn idea from, just in case anyone looks.
It's not my store. I don't know who it belongs to, but while I was Googling it just popped up. They're running quite a few advertorials and stuff, so it was relevant. So next is reading data like a copyright.
So there are only two modules left. It's the home stretch, guys. Thanks for watching. I'll see you in the next one.

Transcript 29

David Briggs | 00:00
Onto the penultimate module. This is module 29 of 30: Reading data like a copywriter. Now, when I started my copywriting career, I would be given briefs, I would complete the work, and then I wouldn't hear from people.
That often happens to junior copywriters. But any good copywriter is worth their salt. If you're doing the only you're doing the copywriting for your business or you're hiring someone to do your copywriting, they should be extremely invested in the performance.
Because if you are a direct response copywriter, your results are measurable. There is no hiding behind things very different to a content writer, where the metrics can be quite soft. Then it's hard to know what the payoff is.
That's why good copywriters earn a lot of money because the impact they can have on your business is very significant. It's important to note that in many ways, anything that you produce that your customer hears or sees that is requiring them to take action is copy.
So it is the backbone of your whole business. Those words that don't really seem like much. You cannot outmaneuver your copy. No hacks or tweaks or tightening up will outperform having better copy.
That's an absolute fundamental truth. Anyone who's worked in any business for any length of time will tell you the same thing. So when I'm looking at data, what kind of things am I looking for?
Well, it varies. It depends on what you know what the purpose of my campaign is, what I'm trying to do. But here are some major ones. Most of these will be familiar. Marin can advise from a media buying perspective of what metrics he looks for. Off can advise on what he's looking for and he's doing conversion rate optimization.
Amy can advise from the creative strategy perspective because her and I, our roles overlap a lot. Not for cure but in terms of what we do for our varying clients and businesses. So some of the things I look for...
So I'm just going to share those with you and the reasoning behind it. So oftentimes, data tells you what to fix, not whether to give up. So if I see that there's a significant drop off between a hook and a
lead, then... Or a hook on the main body, I know that the leads probably weak. If I see that an advertorial has a low click-through rate, then obviously the advertorials not doing what it needs to do. It shouldn't be black and white. Often even in ads that are failing or not hit the KPIs that you're trying to aim for, a lot of learning can be done and that can inform the next decision.
So don't think in terms of "it worked or it didn't." Think in terms of "what have I learned from this and how is this going to make my next decision better?" Because I gained something, even in every single thing, I didn't hit those KPIs. The data isn't a verdict on you, okay?
It's a map of your ad or of your piece. So the consumers, your customers, they're watching it, they're reading it or whatever they are telling you whether it is relevant to them or not and how they respond, where they drop off, what they click on, how they interact with it.
That's why heat mapping is so important. Unpicking that story is enlightening you. Okay, so it's about diagnostic. How do we diagnose from what the data is telling us and then make better decisions? So each metric points at a piece of copy.

Before the hook rate, you got the thumbnail rate on a video, right? So typically I aim for thumbnail rates of 90% or higher, and that is the very first frame right before the video plays. Is it disruptive? Is it catching attention? Is there a text overlay that gives people a sneaky hint as to what they might get if they invest their time in watching my video? Then you have your hook, right? The first three to five seconds of your ad is even less on TikTok. You've got a two-second hook rate to get someone to stay. You've got your click-through rates, click some over impressions, your hold rate, and how long are people watching the video? You got your conversion rate.

Right conversions from clicks. They're really important metrics to always be aware of because they really help you understand what's going on. So thumb stop, hook rate, hold rate, conversion rate are my biggest tells.

So did the first three seconds work? If your hook rate is low, under 20%, typically my hook rates are 40% or higher, but anything under 20% the thumb didn't really stop.

It's not doing what it needs to do. The visual's not interrupting. The first frame isn't working, and the opening setup isn't opening a loop. There's something that needs to be fixed there. So fix the first frame and the first line. You can go back to module 15 if you need a refresher on that.

No healthy hook rates. 25-35% and 40% and up. The opening worked where it delivered on what they were expecting, their promise. It got their attention.

That's good. Okay, so if you're hitting those metrics like, "This is great, move on." The hook's working, so you can move on to the next part. So, did the headline earn a click? If under 1% of the viewers watched, viewers didn't click the ad. They didn't promise enough to be worth a second action.

Okay, so a lot of the times, this is a trap that ads fall into from inexperienced copywriters where we know education's important, education's super important, but if you do not weave in those direct response elements, for example, right then, people don't know they've got to take action. Sometimes you just edit and an ad looks like an education video and they go, "That was really good education, thanks very much."

Then they go about that they're not connecting it to a product because the direct response elements aren't woven through it. So healthy CTRs of 1.5% are not again, niche dependent, situation dependent. The headline was carrying weight. Your Facebook headline was carrying weight and gave people a reason to click. It was specific enough to act on. It told them what needed to happen. Did the body keep watching?

So after the hook, you normally have the lead. The lead, depending on the length of the out, is the transition to the main body. So if I'm iterating, I'll typically change the hook and the lead, and I can keep a lot of the main body very similar, right?

If the hold rates are under 30%, the hooks worked, but then it's not paying off. Maybe you open a loop that you're not paying off quick enough. Maybe there's a disconnect between what was promised in the hook and what you're actually saying.

So start thinking about what's going on there. Was the mechanism unclear? Was the social proof not doing enough of the heavy lifting? Did it take too long to get to the point of what you're saying? So, healthy hold rates indicate that the body is doing its job right. It shows that you're giving them information, you're directing them towards a sale. You're helping them progress, you're helping them understand better, you're highlighting their problems, they feel seen, spoken to, all of that good stuff.

Then conversion rate, right? Did the page convert the click? So, again, this goes up and down and it is quite niche dependent. Some niches have higher conversion rates than others.
A low conversion rate indicates that the click was earned, but the conversion wasn't okay. The page is failing to convert qualified traffic. So why is that? What is happening between those points? That there's not enough trust built, there's not enough social proof, the mechanism isn't clear enough. I don't see how it's relevant. I don't feel it's urgent enough to be lots of disconnects right there.
So if you know your page is performing very averagely or under below average, speak to Wash about what needs to be done. Sometimes some minor tweaks to a page, some restructuring, a better hero section which is the biggest focus can make a huge difference to conversion rate. Actually, a page that looks like it's underperforming can be brought back to life and perform really well with the right touch and the right expertise. When your pages convert, it means you're really completing that customer journey.
So you've taken them through wherever they started, you've changed their beliefs, you've given them a real solution, you've shown how the product delivers that you've given them reasons to act now, and you've shown them and it works through social proof, all of those kinds of things, right?
That's when we know we've got a complete customer journey and a successful kind of funnel when all of those... It's like the stars are aligned and everything's clear to that customer. So read the metrics.
So look at your account. If you've got a senior level copywriter, they should be asking you for access, and if not accessing because not everyone wants to give access, they should be asking for feedback on those last ten scripts that I delivered, which ones had the best hook rates. Then they can analyze which hooks are worth which ones are the best hook rates. So I can analyze which bodies are working I might have. All right, so for the first three outs of the hooks, we're outperforming the rest.
But then the body copy on ad seven was really strong. Okay, so let's Frankenstein that together. Let's see if we can take the hooks from here and add them to the body from here to get something that performs better than both, right? They should be asking, "What's the click-through rate? Is it getting clicks?"
Right, if it's not getting clicks, typically it's because people don't realize they've got to take an action. There's no urgency, there's no drive, there's no direct response push towards doing that, and then the conversion rate as a... I don't like to label things, but as I am now having to call myself is a full-stack copywriter, so I will typically work on any copy any e-commerce business needs. Write from top-of-funnel ads for unaware audiences, right? To backend sunset emails, right? I can write across the scope of the business.
I have the luxury of doing that I can see where the pieces fit together. If you've got a copywriter that's just writing ads for you, for example, nothing wrong with that. But then if it breaks, you're going to have to make the assessment of why something isn't performing based on the pieces that then follow it.
So typically a copywriter's going to perform better the more information you give them. Most copywriters, in my experience, they're excited about performance. We know this game is hard. We know that the majority of a rewrite are going to fail.

That's the law of averages. That's how this market goes. But the excitement of writing winners and watching a brand scale off the back of your insights, your research is exciting. It's what makes this job fun.
It's what makes this worth doing. So to share information with your copywriters, give them data feedback. So you know, even if it's negative, right? None of these hit the KPIs, but this hook performed really well.
Okay, great, that's something I can still work with, so don't be afraid to share high click-through rates with low conversion rates. The typical diagnosis is the ad is overpromising. This happens a lot. This is really important if the ad is going to an advertorial. A lot of advertorials will not show the product's price on the advertorial. They will use buttons like "Check availability" and "Apply discount." Now, I really like that personally, because it's not giving away too much too early.
If you have the price point on the advertorial, sometimes people just scroll and they look at the price first, and they haven't read the copy, and then they're put off by the price before they go and understand the value.
So "Check availability" and "Apply discount" or something like that is a really powerful CTA button for ad copy. However, you will get inflated click-through rates because there will be a certain number of people, a certain percentage of people, that click through. They're just clicking through to see the price.
It's just that curiosity got the better of them, and they never had any intention of buying. So just be aware of what it is that you're measuring as well. So people couldn't... Why? It could be an ad page mismatch.
So the ads promise one thing, they get to the page, and it's like... This is a really watered-down version of what I heard earlier. This isn't what I was promised. I'm not interested anymore. It could be a hollow promise.
Right? The hook or something implies a benefit, and then it's not really paid off anywhere. If you're offering a timeframe, then you need to be consistent with that timeframe. It could be the wrong page format, right?
Maybe you're selling a product that's quite complicated, and it's going straight from ad to a PDP, and there hasn't been enough education in between. So if I see that there's a massive drop-off between if I'm getting clicks, it's great, but the conversion rates are really poor. I'm looking at what bridge page needs to go in there. What do I need to put in there to make more of those people who are clicking and clearly engaging with the ad confident enough to make the purchase in my PDP? Pit could be price shock.
Okay. So if your price point is premium or outside the scope of normality, very rarely, as I've said before, is it a price issue? It's normally a value issue. So the price point you need to be setting people up for the expectation of the price point because if you go from... Yeah, don't worry, it's not much...
Then they get to the page and it's $500 for the supplement or whatever that is breaking their expectations and therefore their trust drops. They feel like they've been lolled into this thing where you're offering them this great solution and then suddenly it's like you've got to pay a huge amount of money for this.
So it's about continuity. What are they expecting to see? Are you being transparent with what their individual journey is? Does it make sense? Is there any gaps in the education? How do we prevent any leaks?

At each point, you should be able to diagnose where the drop-offs are and start to create hypotheses around how you fix those leaky points of your funnel. So a random example here. SNZIO's UGC ad.
Okay. So, Senio, they add a hook rate of 31%, hold rate, 22%, convert click-through rate 1.7, and conversion rate of 0.8. So some key metrics there, right? So the hook rate of 31% is okay, it's middling.
It's working enough for now, but then the whole rate is 22%, it's leaking. So what we're seeing, if we're to diagnose that, is the hook rate's doing an okay job. The body's losing them. We need to fix that. The click-through rate is healthy among the people that stayed so obviously towards the back end of that video.
It's doing enough to encourage the click and then but the CBRS terrible 0.8% way below the 2%. So we're running the click but not the conversions. So what do we do with this? So first thing would be to fix the body of the script that is not working, that's not resonating.
So we start to diagnose. What is it about it? Is it the wrong person in the wrong awareness stage? Am I speaking like it's level 2 market sophistication when actually it's level 4? What's going on? Diagnose it and fix it, and then you want to audit the page for continuity.
All right, so where... Once they click through, what are they then seeing? Because if they're clicking through and they're confident when they click through, the conversion rate drops off. There's a disconnect there where something's not adding up to them. Is it that they weren't set up for the price? Is it that there's not enough education going on? Is it that it's overpromising and then the page isn't able to deliver? Think about those things that are working, even if they're not working at 100% of their potential, but they're like 80%. Leave them alone. Always try and prioritize the things that are going to actually move the needle the most. We're not aiming well, we're aiming for the best that we can do. We're not aiming for perfection. Perfection is a waste of time.
It's impossible to be perfect. The truth is, even with the most skilled copywriters in the world, it's hard to know what an audience is going to respond to. Markets change, new products come out. Even what's happening in the world can change how people perceive ads at different times in their lives. When there's talk of war on the news, survivalist stuff goes on in times of... In times of poverty.
So if news comes out about global recessions and things like that, people become more risk-averse, which is fascinating to me. So they're more likely to spend more money on a product they're familiar with than they are to spend less money.
Take a risk on a new brand they've not heard of before. So all of these myriad of moving parts are all moving around you, and you just have to make the best decisions you can make based on what you can hypothesize and know from your data. No one expects perfection.
So diagnostic checklist for one underperforming... As you know, this is a good habit to get into. It's a good exercise. You can do this once a week with your copywriter or... Or whatever with your team and just figure out. Pull one underperforming ad you ran, and get those metrics.
So ideally, you want to pull one that you had belief that it worked or maybe it scores well on one of those metrics. So it's worth salvaging. Then you go through the data, and then do the diagnostic chain.
So where does it break? What's not working about it, and then see if you can fix it, right? What would you do in that scenario to improve the performance of that ad and continue with that? So

if it ain't broke, don't fix it. As we say in the UK, if it's performing well, leave it alone once you know it again... We're not going for perfection, we're trying to hit our targets across the KPIs we want. Once we've got multiple wins running, we can go back and revisit the ones that are already performing well and see if we can get even more out of them. We can do variations of them, but don't just throw away stuff because on the surface it doesn't look like it's performing... Many times, it can be a few tweaks that can absolutely transform the performance of an ad, and it makes it so you haven't just wasted all that time and investment in creating it.
Next up is Module 30: Building Your Own System, the ultimate final finale of the new EEA copywriting course. Hope you look at... Are looking forward to it. It's a good one.

Transcript 30

David Briggs | 00:00
The final module of the new copyrighting course. I hope we've had a ton of value out of this. A lot of work went into this, really thinking about the decisions that I make and why I make them. What's worked for past clients. What hasn't worked.
Trying to put it all together for you so you can get the benefit of all that learning that I've done over a pretty long career now. So let's bring it all together. Final module building your own system.
This is talking about frameworks. Maps talk a lot about systems and operating and making things repeatable and so on. Just like any other habit, you want to build it slowly over time. You want to stick to it, not move on to it, make it a non-negotiable.
Then it starts to become muscle memory. It becomes your go-to thing. You start reading things more analytically, your copy performs better, and your sales go up. So let's get into today's presentation and finish up this monster course that we've put together here.
So remember in the foundation section, right? We talked about you don't create desires. Desires are already in your market. People want to be fitter, more attractive, younger, stronger, pain-free. The desire is already there, you've got to tap into it. Customers are already searching to some degree, they already have. Once they're already dissatisfied, they don't need you to create that in them. It's already there. You need
them to be found. So it's more of a searching thing than a creation thing. Your job is really to detect and channel that desire and that's what every framework in this course is there to do.
No point... Do I take, say, in this course, you need to find someone and take them on this massive journey and make them believe in this thing like the desires and everything is there. So remember, there is no point in wasting your time trying to convert customers who aren't going to be your customers. You want to find the ones who are and speak to them in a way that they understand.
Okay? So, as Eugene Schwartz says, "Copy can't create desire. It can only take hopes, dreams, fears, and desires already existing in the hearts of millions and focus those already existing desires onto a particular product." This is the gateway. This is the ticket. This is the thing that helps you become the idealized version of yourself. We all have those desires to some degree at different points in our lives. There will be many that you have right now.
But that's what we're speaking to. Then we're connecting the dots between how the product can help them achieve that. So the system that I developed with my business partner Kent is called the Drive System. I love the Drive System.
You've already been using it. If you follow through these modules in this course. So I'll talk you through it, how it works, and everything, and how those components work together. So drive stands for discover, reframe, ignite, variate, and evolve. The discovery is all your research.
It's the master's drive in your market is the life foresight, it's the sophistication, it's the big idea, it's everything around which your campaign audits. It's the foundational work. The next bit is the reframe. We identify the belief block in the sales. We talk about two-part mechanisms that break it. We look at visible proof and social proof and ways of stacking that proof in a way that's believable and authentic. Ignite is when we fuel that desire with emotion. Emotion is a

fundamental part of effective copy. People buy in emotionally heightened emotional states and they justify their purchase with logic.
But if you cannot connect with people on an emotional level, you will fail to move them to take action. Emotion drives action and the persuasion sequences. What makes someone put out their cards and just act there and then that is what direct response is about.
Then variate. So once we have those... We know how to talk to people, we understand their emotional state, we know what their current belief is and what's blocking them from progressing and moving towards a purchase. We know all of that. We need to vary it. How do we find angles? Keep them fresh. Different formats. Create a full creative library that hits different parts, different awareness stages, different target audiences, different desires, all with that one central big idea that's underpinning the campaign idea. What is the main thing that your product solves?
Then evolve. Evolution is the final step when we get feedback loops started and we look at what worked, what didn't work, what people responded to, and what they didn't. We evolve our decision-making.
From that point, we start to think about... "Will that have worked? What do we do next?" "This didn't work, why didn't it work?" "Is it because our targeting was off? Do we need to go back to our research? What was happening here?"
So we started to look for patterns and how we can use those patterns to make it better, more informed, and more effective decisions we go forward. So as I said, you've already been running Drive. Okay, so modules like one to 13, right? Awareness, sophistication, master desires, life for... Say, angles, ICPs, big ideas they all come under the D for drive, right? Discovery modules like 14 to 22, breaking beliefs, how mechanisms work, handling objections, advertorials there in that reframe section. These are all about how you reframe modules. 18 to 23, sorry to 24. You've got how you ignite. How do you build in persuasion stacks? How do you move people to take action? How do you know, take those raw emotions and turn them into stories, VSLs, architectures, emails, and then vary? We talked about creative diversity, persona splits, iteration matrix, how do you take a core concept and diversify in multiple different ways, target new audiences, and new scenarios with this?
Then finally, the evolved when we looked at reading data like a copywriter and making decisions from there. So what I want you to really understand is these aren't kind of 30 theoretical, broken-up modules that are unusable. Everything that you have done to this point is building a complete system for your copy and to a small degree your creative strategy as well.
That's going to make your job easier when it comes to creating and writing copy. That's going to give you a deeper and better understanding of your target audience, your product, and how to position yourselves.
It's going to help you hit more winners more frequently and ultimately, that's what we want to do as copywriters. We want to produce more winners at a faster rate, more regularly.
It's efficiency. Not everything you write is going to be a winner, but with these systems in place, you will increase the percentage of winners, your hit rate will improve. So once you've got all your information, you can run it, right? You want to run it?
So week one, you might want to do your discovery documents. Week two, you reframe and you can figure that part out. The line mechanisms completely ignite grids, that kind of thing. Week three, variate and start to produce.

Okay, so now we've done all the hard work, we've done all the foundation. We know who we're talking to, what they say, etc. We can start to produce some as write some scripts. Look at different formats and different angles and get some stuff produced. A great place to start with video ads is like b-roll voiceovers or mash-up style ads. They're very low effort to produce. You can use a lot of existing b-roll, they're low cost to produce, and they're a good place to start. They're not the only place, but a good place.

Then launch. So ship your concepts and then start running those diagnostics. Start getting feedback loops going. What's working, what's not? Make sure you have your KPIs in mind so you've got a set spend limit on how long you're willing to test, and so on. Speak to Marion. He's the man about that.

Start those feedback loops. So one kind of thing that you can do is create the one-page version of this. I like big, long documents. I use the "Edit on Google Docs" feature and replace the keyword search of my own documents, and then I can find what I'm looking for within my own documents.

It's a little hack that works for me, but you can do a one-pager where you keep it relevant, somewhere you can see it every single day. So it makes all those documents more manageable if you're someone who feels like document overwhelm.

So you know what? It could look like this, right? So the big idea. So in one sentence, what is the big idea? And you want to update it quarterly. So once you've had an entire quarter feedback loop, you've seen what's working, what's not working. Does your big idea still stand? Has it adjusted? Is the market telling you actually the big idea needs to change because what your customers are responding to isn't echoed in that big idea?

Then this week's questions. So what step of drive am I in this week? What output am I producing? Am I still in research? Am I going back to research to discover some new ICPs? What am I doing? What is my primary goal for my copy for this week?

Then the active swipe, right? So three winners worth studying right now. Keep a swipe file. You can save them inside of Atria. You can save them inside of HubSpot. You can save them inside of Foreplay. Keep that library there, but copy the transcripts. Put them on a dock. Don't just have it as a dead thing where you're just collecting stuff that you never look at. Analyze them. Why are these ads working for my competitors? What can I take from them that are going to help me?

So look at things from direct competitors, if you have some. Look at indirect competitors. Who else is in your category? If you're in pain, like back pain relief, for example, and you're selling a brace...

Look at what the cushion cris are doing. Look at what the rap people are doing. Look at what the supplement people are suggesting. See how you can steal ideas to keep your concepts fresh. What's working, what's not? Have they missed an opportunity that you can monopolize on? Watch the numbers, right?

So figure out the numbers you're keeping an eye on: hook rates, hold rates, CTRs, CVRs, thumbstock rates. What's relevant could be scroll depth. If you're looking at an avatar, for example, time on page could be your heat maps, and you study in your heat maps to see how people are engaging with your longer form pages and then start logging the patterns. What sold well? What didn't? What kind of positioning worked best? What desire did you speak to that got the best return?

Maybe you notice that every time you start with frustration angles, you're getting a really good response rate. Spend more time doing that. Figure out who else you can express that frustration to and help them see themselves in that ad.
We one can feel small because a lot of people don't want to do the ugly work at the start, right? It seems really theoretical. These research documents. I've got my big idea and my angle map, and I've got this. It feels really abstract, but do not skip it, because it's like investing a day now to save you a month later.
The core docs are so valuable because it's doing all that heavy lifting upfront. Then, when it comes to the creative thing, you're not having to dip back into your logical mind. You can stay in creative mode because you'll find that if you're context switching between two mindsets...
If I'm dividing up my day, I don't do research, then copy, then research, then copy back to back. Part of my day is based on research. I'm most creative at night. That's just how my brain works. So I try and leave my most creative or most creatively challenging tasks for in the evening once my kids are asleep or a cup of tea or a glass of wine or whatever, and I can somehow tap into my creativity more effectively.
If you are context switching between logical brain and creative brain, you just fatigue yourself. It's not an efficient use of your time. By month three, you've got twelve completed cycles.
If you think about it in terms of one month cycles, you've got twelve completed cycles. You should have a swipe folder of a bunch of winners. You should have patterns showing what's working, what emotions set in, how you know what, when you position yourself against a different category, is that working?
Then by month six, you got a brand voice document built from real winning copy, right? Your Hub, your Persona files, AI prompts that work. You're building an entire system, an ecosystem around all of those core documents and then creating continual and consistent feedback loops all the time.
So it's getting tighter, and you're fine-tuning in this engine that you're building. By month twelve, you've got performance data layered on all your different frameworks. So you know that this ICP responds best to this angle. This ICP responds best to this angle. This Desire is consistent across all the angles. There's no more... You've removed as much of the guesswork as it is humanly possible.
You know what wins for each buyer? That gives you so much power over the decisions that you then make going forward. So twelve months sounds like a long time. It's not. I can't believe at the time of recording this that we're already in May. It feels like Christmas was just a minute ago. We're already heading into summer, if you can call that here in the UK.
It's so amazing how quickly time progresses and how much you can achieve in such a relatively short space of time. In the Halbert Letters, sorry. The Born Letters by Gary Halbert. The greatest, most exciting, and most fulfilling work you will ever do is work you do on yourself. The same goes for your craft every day. No days off. There are some copywriting communities that still absolutely advocate for handwriting copy.
So literally print it out and copy it out by hand because it triggers a different part in the brain. You can do that if you want to. I've done it in the past because I felt it was valuable. But the point is to be continually exercising that muscle. I cannot express enough just how important copy is to a digital business.

It is arguably one of the most valuable life skills you can ever learn. The art of persuasion. How do you get people around to your way of thinking? How do you break down beliefs that are misconceptions? How do you educate people in a way that makes them want to take action? It's not just an incredibly important business skill, it is an incredibly important life skill. In order to get good at any skill, it requires putting in the reps. And that doesn't mean sprints. This is a marathon, and little and often is always going to outperform.

Like doing a big try to do a big chunk in one go. You will not master this overnight, but week on week, if you put the reps in, you will be better than 95% of the market out there that claim to be copywriters and are just running generic AI. They don't have the research, they don't have the understanding, and they don't understand human psychology. You will be far and away ahead of that.

As the general market becomes more generic and more obviously AI, and people are getting lazier about what they do, you will just stand out more for the right reasons. So, really don't overlook this skill.

Coming right back to the start of everything, particularly when we introduce the AI can generate copy, it does not generate judgment. That is the biggest takeaway in this AI as constantly evolving.

It's so exciting to get. It's so easy to get excited about the newest tool. ChatGPT can do this now, and Claude just figured out this... It can connect to this and it can connect to this. As I said, I use all these many of these AI tools to a pretty high level, but that's because I have mastered my skill. This is... I operate at the highest level of copy. I work with some of the... I've worked with some of the most successful direct response brands. I'm very privileged in that regard, but the reason I'm able to do that is because I have the judgment in place. Before AI, I was doing it in the old school way. Now AI has come along.

I've still tried to develop my skills and better understand human psychology. You lead AI, it never leads you. You are the shot caller. You are the judgment behind the operation. You need to tell it which mechanisms to lean and which objections to preempt, which angles to test, what metrics are broken, and which iterations to ship. All of that thinking comes from you. You can work collaboratively with it. You can say, "These are the things I'm thinking. Give me reasons for and against why this should be my next action."

But you are the shot caller in politics. For example, if you talk about the kings in ancient times, they would typically be a king who was the shot caller, and he would have a body of advisers, and you would have a war advisor and a national home advisor and then a farm advisor and a politics advisor and all this.

They would all be experts in their fields. And they would give him the information, but he would ultimately make the decision. In this case, you can balance ideas with AI, you can treat AI like your advisor. This is what I'm thinking, this is the reason I'm thinking of it. Give me your reasons for and against.

But you call it... Do not let AI decide things for you, or you're going to be disappointed with the results. That's why you spent 30 modules really refining and learning as much of these skills as you can, because when you put these together, you'll be an absolute powerhouse.

So what's the last thing to do, really? Write your one-page operating doc. So what's your big idea for your brand? In one sentence, that's the core concept, the core problem you solve, the core thing that your product delivers, and the way it does that your ads will orbit around, do the

drive, dock the drive loop, right? Mark when you're starting, what week you want, what are the goals for the week regarding your copy set up, active swipes, get your whatever tool is you want to use, they're all pretty much of a muchness. I like different ones for different things, but I could survive on any one. I could just use a... Or I could just use for play, or I could just use get hooked. They all do the same function. Have a swipe file.

But be analytical with it, update it regularly, actually look at them, study them. Why is it working? What can I learn from this? Get into your metrics, and then run those cycles, and you put all that together. The difference it's going to make to you is just going to be absolutely astronomical. I can promise you that because I've seen it firsthand. How powerful the right copy can be for the right businesses.

What's drive? This is drive. So discover finds the desires and what's causing them, reframe, breaks their wrong belief, and instills a new one. Ignite loads it with fuel. Fuel emotional connection, putting the pieces together for them in a way that is very human, unreal, and dimensionalized. Variate puts it on their screen in different ways for different audiences, and Evol learns what's sold so you can create a tighter feedback loop next time.

That's the system. The system works. Now you've got it. Enjoy it. If you have any questions about anything you've seen within these thirty modules, I have the copywriting channel in the Ecomm Architects group. Ask me, you'll see that I'm pretty responsive. I get back to people as soon as I can. I answer questions, I look at stuff wherever possible, and I have a call every two weeks. Bring your copy, show me your Claude that you've built, and let's just be successful, happy, and productive together, and let's see if we can stack some cash, right? Guys?

That's enough for me. Thank you so much for watching. I hope you enjoyed the new V2E Ecomm Architects Copy Course. I'm David, and good luck.
